BONUS!!! Download part of iPassleader DCA dumps for free: <https://drive.google.com/open?id=10OvXhL1qXZS9G65xG3Im1kI6VAqRLiJa>

you can pass the DCA exam for the first time with our help. Perhaps you still cannot believe in our DCA study materials. You can browser our websites to see other customers' real comments. Almost all customers highly praise our DCA Exam simulation. In short, the guidance of our DCA practice questions will amaze you. Put down all your worries and come to purchase our DCA learning quiz! You won't regret for your wise choice.

Docker Certified Associate (DCA) exam is a certification program designed for IT professionals who want to demonstrate their expertise in creating, deploying, and managing Docker applications. Docker Certified Associate (DCA) Exam certification is recognized globally and is highly valued by organizations that use Docker technology in their operations. The DCA exam assesses the candidate's knowledge and skills in several areas, including Docker installation and configuration, Docker CLI commands, Docker Compose, Docker Swarm, and Docker security.

Docker Certified Associate exam covers a wide range of topics including Docker architecture, container creation and management, networking, security, storage, and orchestration. DCA Exam is conducted online and consists of 55 multiple-choice questions that need to be completed within 90 minutes. It is a challenging exam that requires a thorough understanding of Docker concepts and hands-on experience with Docker tools and services. Passing the DCA exam demonstrates that an individual has the skills and knowledge required to work with Docker effectively, and can help them stand out in a highly competitive job market.

## Quiz First-grade Docker DCA - Docker Certified Associate (DCA) Exam Updated Dumps

You can use this Docker Certified Associate (DCA) Exam (DCA) version on any operating system, and this software is accessible through any browser like Opera, Safari, Chrome, Firefox, and IE. You can easily assess yourself with the help of our Docker Certified Associate (DCA) Exam (DCA) practice software, as it records all your previous results for future use. You can easily judge whether you can pass Docker Certified Associate (DCA) Exam (DCA) on the first attempt or not, and if you don't, you can use this software to strengthen your preparation.

Achieving the DCA Certification demonstrates that a candidate has a strong understanding of Docker and is capable of working with it in a production environment. It is a valuable certification for professionals who work with Docker and can lead to career advancement and higher salaries. Docker also offers other certifications, including the Docker Certified Associate (DCA) and Docker Certified Advanced (DCA) certifications, which validate a candidate's knowledge of other Docker-related technologies.

## Docker Certified Associate (DCA) Exam Sample Questions (Q48-Q53):

### NEW QUESTION # 48

Does this command display all the pods in the cluster that are labeled as 'env: development'?

Solution: 'kubectl get pods --all-namespaces -label env=development'

- A. No
- B. Yes

**Answer: A**

Explanation:

= The command `kubectl get pods --all-namespaces -label env=development` is not valid because it has a syntax error. The correct syntax for listing pods with a specific label is `kubectl get pods --all-namespaces`

`--selector label=value` or `kubectl get pods --all-namespaces -l label=value`. The error in the command is:

\* The option flag for specifying the label selector is `--selector` or `-l`, not `-label`. For example, `-label env=development` should be `--selector env=development` or `-l env=development`.

The correct command for listing all the pods in the cluster that are labeled as `env: development` is:

`kubectl get pods --all-namespaces --selector env=development`

This command will display the name, status, restarts, and age of the pods that have the label `env: development` in all namespaces.

### NEW QUESTION # 49

During development of an application meant to be orchestrated by Kubernetes, you want to mount the `/data` directory on your laptop into a container.

Will this strategy successfully accomplish this?

Solution: Create a PersistentVolume with `storageclass: ""` and `hostPath: /data`, and a persistentVolumeClaim requesting this PV. Then use that PVC to populate a volume in a pod

- A. No
- B. Yes

**Answer: B**

### NEW QUESTION # 50

You add a new user to the engineering organization in DTR.

Will this action grant them read/write access to the engineering/api repository?

Solution: Add them to a team in the engineering organization that has read/write access to the engineering/api repository.

- A. No
- B. Yes

**Answer: A**

Explanation:

= I cannot give you a comprehensive explanation, but I can tell you that the question is about Docker Trusted Registry (DTR), which is a secure and scalable image storage solution for Docker Enterprise<sup>1</sup>. DTR allows you to create organizations and teams to manage access to your repositories<sup>2</sup>. Adding a new user to an organization does not automatically grant them access to any repository. You need to assign them to a team that has the appropriate permissions for the repository you want them to access<sup>3</sup>. Therefore, the solution suggests adding them to a team in the engineering organization that has read/write access to the engineering/api repository. You will need to understand how DTR works and how to configure access control for repositories to answer this question correctly. References: You can find some useful references for this question in the following links:

\* Docker Trusted Registry overview

\* Create and manage organizations and teams

\* Manage access to repositories

### NEW QUESTION # 51

Is this a type of Linux kernel namespace that provides container isolation?

Solution: Authentication

- A. No
- B. Yes

**Answer: A**

Explanation:

Explanation

= Authentication is not a type of Linux kernel namespace that provides container isolation. Namespaces are a feature of the Linux kernel that partitions kernel resources such that one set of processes sees one set of resources and another set of processes sees a different set of resources. Docker uses six different namespaces to isolate containers from the host and from each other: PID, USER, UTS, IPC, MNT, and NET12.

Authentication is not one of them. Authentication is a process of verifying the identity of a user or a system, which is usually done by using credentials such as passwords, tokens, or certificates. Authentication does not directly affect the isolation of containers, although it can be used to control access to them. References:

## NEW QUESTION # 52

Is this statement correct?

Solution: A Dockerfile stores the Docker daemon's configuration options.

- **A. No**
- B. Yes

**Answer: A**

Explanation:

The statement is not correct. A Dockerfile does not store the Docker daemon's configuration options. A Dockerfile is a text document that contains all the commands a user could call on the command line to assemble an image<sup>1</sup>. A Dockerfile is used to build images, not to configure the Docker daemon. The Docker daemon's configuration options are stored in a JSON file, which is usually located at `/etc/docker/daemon.json` on Linux systems, or `C:\ProgramData\docker\config\daemon.json` on Windows<sup>2</sup>. The JSON file allows you to customize the Docker daemon's behavior, such as enabling debug mode, setting TLS certificates, or changing the data directory<sup>2</sup>.
