NEW QUESTION # 159

Of the various types of "Hackers" that exist, the ones who are not worried about being caught and spending time in jail and have a total disregard for the law or police force, are labeled as what type of hackers?

- A. Black Hat Hackers
- B. White Hat Hackers
- C. Gray Hat Hackers
- **D. Suicide Hackers**

Answer: D

Explanation:

Explanation/Reference:

Explanation:

Suicide Hackers are a type of hackers without fear, who disregard the authority, the police, or law. Suicide Hackers hack for a cause important to them and find the end goal more important than their individual freedom. The term "Hacker" originally meant a Unix computer enthusiast but has been villainized in the media as a "Criminal Hacker" for a mass audience. A hacker used to be known as a good person who would add functionality within software or would make things work better. To most people today "Hacker" means criminal "Criminal Cracker", it is synonymous with Cracker or someone who get access to a system without the owner authorization. As seen in news reports in 2011 and later hackers associated with the "Anonymous" movement have attacked finance and/or credit card companies, stolen enough information to make contributions to worthy charities on behalf of organizations they see as contrary to the public good.

These sorts of attackers/hackers could be considered suicide hackers. Some did get caught and prosecuted while carrying out their cause. Nobody can know if they knew their activities would land them in court and/or prison but they had to have known of the risk and proceeded anyway.

Incorrect Answers:

B: Black Hat hackers are also known as crackers and are merely hackers who "violates computer security for little reason beyond maliciousness or for personal gain". Black Hat Hackers are "the epitome of all that the public fears in a computer criminal". Black Hat Hackers break into secure networks to destroy data or make the network unusable for those who are authorized to use the network.

C: White Hat Hackers are law-abiding, reputable experts defending assets and not breaking laws. A white hat hacker breaks security for nonmalicious reasons, for instance testing their own security system. The term "white hat" in Internet slang refers to an ethical hacker. This classification also includes individuals who perform penetration tests and vulnerability assessments within a contractual agreement. Often, this type of 'white hat' hacker is called an ethical hacker. The International Council of Electronic Commerce Consultants, also known as the ECCouncil has developed certifications, courseware, classes, and online training covering the diverse arena of Ethical Hacking. Note about White Hat: As reported by Adin Kerimov, a white hat would not be worried about going to jail as he is doing a test with authorization as well and he has a signed agreement. While this is a true point he BEST choice is Suicide Hackers for the purpose of the exam, a white hat hacker would not disregard law and the authority.

D: Gray Hat Hackers work both offensively and defensively and can cross the border between legal/ethical behavior and illegal/unethical behavior. A grey hat hacker is a combination of a Black Hat and a White Hat Hacker. A Grey Hat Hacker may surf the internet and hack into a computer system for the sole purpose of notifying the administrator that their system has been hacked, for example. Then they may offer to repair their system for a small fee.

OTHER TYPES OF HACKERS

Elite hacker is a social status among hackers, elite is used to describe the most skilled. Newly discovered exploits will circulate among these hackers. Elite groups such as Masters of Deception conferred a kind of credibility on their members. Script kiddie A script kiddie(or skiddie) is a non-expert who breaks into computer systems by using pre-packaged automated tools written by others, usually with little understanding of the underlying concept-hence the term script (i.e. a prearranged plan or set of activities) kiddie (i.e. kid, child-an individual lacking knowledge and experience, immature). Often time they do not even understand how they are taken advantage of the system, they do not understand the weakness being exploited, all they know is how to use a tool that someone else has built. Neophyte A neophyte, "n00b", or

"newbie" is someone who is new to hacking or phreaking and has almost no knowledge or experience of the workings of technology, and hacking. Hacktivist A hacktivist is a hacker who utilizes technology to announce a social, ideological, religious, or political message. In general, most hacktivism involves website defacement or denial-of-service attacks.

NEW QUESTION # 160

The overall goal of a penetration test is to determine a system's

- A. reliability under stress.
- **B. ability to withstand an attack.**
- C. capacity management.
- D. error recovery capabilities.

Answer: B

Explanation:

A penetration test is a simulated attack on a system or network, performed by authorized testers, to evaluate the security posture and identify vulnerabilities that could be exploited by malicious actors. The overall goal of a penetration test is to determine the system's ability to withstand an attack, and to provide recommendations for improving the security controls and mitigating the risks¹². NEW QUESTION # 161

Which of the following was designed to support multiple network types over the same serial link?

- A. PPTP
- B. SLIP
- C. Ethernet
- **D. PPP**

Answer: D

Explanation:

Explanation/Reference:

Explanation:

Point-to-Point Protocol (PPP) is a full - duplex protocol used for the transmission of TCP/IP packets over various non-LAN connections, such as modems, ISDN, VPNs, Frame Relay, and so on. PPP permits multiple network layer protocols to operate on the same communication link.

Incorrect Answers:

A: Ethernet is a link layer protocol in the TCP/IP stack, but Ethernet is not used for serial links.

B: SLIP is a predecessor of PPP which do not support multiple network types over a single link.

D: PPTP is a tunneling protocol which uses a control channel over TCP and a GRE tunnel operating to encapsulate PPP packets.

PPTP tunnels do not handle network types.

NEW QUESTION # 162

Virtual Private Network software typically encrypts all of the following EXCEPT

- **A. Data link messaging**
- B. Session information
- C. HTTP protocol
- D. File transfer protocol

Answer: A

NEW QUESTION # 163

Enterprise Access Management (EAM) provides access control management services to Web-based enterprise systems. Which of the following functions is NOT normally provided by extant EAM approaches?

- A. Role-based access control
- **B. Interoperability among EAM implementations**
- C. Single sign-on
- D. Accommodation of a variety of authentication mechanisms

Answer: B

Explanation:

In general, security credentials produced by one EAM solution are not recognized by another implementation. Thus, reauthentication is required when linking from one Web site to another related Web site if the sites have different EAM implementations.

Answer "Single sign-on" (SSO) is approached in a number of ways. For example, SSO can be implemented on Web applications in the same domain residing on different servers by using nonpersistent, encrypted cookies on the client interface. This is accomplished by providing a cookie to each application that the user wishes to access. Another solution is to build a secure credential for each user on a reverse proxy that is situated in front of the Web server. The credential is, then, presented at each instance of a user attempting to access protected Web applications. For answer b, most EAM solutions accommodate a variety of authentication technologies, including tokens, ID/passwords and digital certificates. Similarly, for answer c, EAM solutions support role-based access controls, albeit they may be implemented in different fashions. Enterprise-level roles should be defined in terms that are universally accepted across most ecommerce applications.
