Fortinet NSE 5 - FortiSIEM 6.3 Sample Questions (Q58-Q63):

NEW QUESTION # 58

Which is a requirement for implementing FortiSIEM disaster recovery?

- A. DNS names must be used for the worker upload addresses.
- B. All worker nodes must access both supervisor nodes using IP.
- C. SNMP, and WMI ports must be open between the two supervisor nodes.
- D. The two supervisor nodes must have layer 2 connectivity.

Answer: A

Explanation:

Disaster Recovery (DR) Implementation: For FortiSIEM to effectively support disaster recovery, specific requirements must be met to ensure seamless failover and data integrity.

Layer 2 Connectivity: One of the critical requirements for implementing FortiSIEM DR is that the two supervisor nodes must have layer 2 connectivity.

* Layer 2 Connectivity: This ensures that the supervisors can communicate directly at the data link layer, which is necessary for synchronous data replication and other DR processes.

Importance of Connectivity: Layer 2 connectivity between the supervisor nodes ensures that they can maintain consistent and up-to-date state information, which is essential for a smooth failover in the event of a disaster.

References: FortiSIEM 6.3 Administration Guide, Disaster Recovery section, which details the requirements and configurations needed for setting up disaster recovery, including the necessity for layer 2 connectivity between supervisor nodes.

NEW QUESTION # 59

What does the Frequency field determine on a rule?

- A. How often the rule will trigger for the same condition.
- B. How often the rule will trigger.
- C. How often the rule will evaluate the subpattern.
- D. How often the rule will take a clear action.

Answer: C

Explanation:

Rule Evaluation in FortiSIEM: Rules in FortiSIEM are evaluated periodically to check if the defined conditions or subpatterns are met.

Frequency Field: The Frequency field in a rule determines the interval at which the rule's subpattern will be evaluated.

* Evaluation Interval: This defines how often the system will check the incoming events against the rule's subpattern to determine if an incident should be triggered.

* Impact on Performance: Setting an appropriate frequency is crucial to balance between timely detection of incidents and system performance.

Examples:

* If the Frequency is set to 5 minutes, the rule will evaluate the subpattern every 5 minutes.

* This means that every 5 minutes, the system will check if the conditions defined in the subpattern are met by the incoming events.

References: FortiSIEM 6.3 User Guide, Rules and Incidents section, which explains the Frequency field and how it impacts the evaluation of subpatterns in rules.

NEW QUESTION # 60

What operating system is FortiSIEM based on?

- A. Microsoft Windows
- B. CentOS
- C. RedHat
