CompTIA DataSys+ Certification Exam Sample Questions (Q118-Q123):

NEW QUESTION # 118

A database administrator has been asked to assign a user the ability to view a data set. Which of the following practices best describes this request?

- A. Password policy implementation
- B. Security audit
  C Database audit
- C. Access control

Answer: C

Explanation:
The practice that best describes this request is access control. Access control is a process that regulates who can access what data in a system based on predefined rules or policies. Access control helps protect data from unauthorized or inappropriate access or modification by granting or denying permissions or privileges to users or groups based on their roles or identities. By applying access control, the database administrator can assign a user the ability to view a data set without allowing them to change or delete it. The other options are either different practices or not related to this request. For example, security audit is a process that evaluates the security level of a system by identifying vulnerabilities or risks; database audit is a process that monitors and records the activities or events that occur on a database; password policy implementation is a process that defines and enforces rules or standards for creating and managing passwords. Reference: CompTIA DataSys+ Course Outline, Domain 4.0 Data and Database Security, Objective 4.2 Given a scenario, implement security controls for databases.

NEW QUESTION # 119

Gary is logging into a system and is providing his fingerprint to gain access. What step of the IAM process is he performing?

- A. Authentication
- B. Accounting
- C. Authorization
- D. Identification

Answer: A

NEW QUESTION # 120

A database administrator needs to ensure database backups are occurring on a daily basis and at scheduled times. Which of the following actions should the administrator take?

- A. Query the database to observe entries.
- B. Review the backup media.
- C. Check the database schema.
- D. Review the server logs for entries.

Answer: D

Explanation:
The action that the administrator should take is to review the server logs for entries. Server logs are files that record the events and activities that occur on a server, such as database backups, errors, warnings, or failures. By reviewing the server logs, the administrator can verify that the database backups are occurring on a daily basis and at scheduled times, and also identify any issues or anomalies that may affect the backup process or the backup quality. The other options are either not relevant or not sufficient for this task. For example, querying the database to observe entries may not show the backup status or frequency, checking the database schema may not reflect the backup schedule or policy, and reviewing the backup media may not indicate the backup time or duration. Reference: CompTIA DataSys+ Course Outline, Domain 5.0 Business Continuity, Objective 5.2 Given a scenario, implement backup and restoration of database management systems.

NEW QUESTION # 121
Which of the following statements best classifies a rollback in a database?

- **A. TCL**
- B. DCL
- C. DDL
- D. DML

Answer: A

Explanation:
A rollback is a Transaction Control Language (TCL) command used to undo changes made during a transaction, ensuring database integrity by reverting to a previous stable state.

NEW QUESTION # 122
A DBA is reviewing the following logs to determine the current data backup plan for a primary data server:
Which of the following best describes this backup plan?

- A. Daily differential
- B. Monthly full, daily differential
- C. Weekly full, daily incremental
- D. Daily full

Answer: C

Explanation:
The backup plan that best describes the logs is weekly full, daily incremental. This means that a full backup of the entire database is performed once a week, and then only the changes made since the last backup are backed up every day. This can be inferred from the logs by looking at the size and duration of the backups. The full backups are larger and take longer than the incremental backups, and they occur every seven days. The other backup plans do not match the pattern of the logs. Reference: CompTIA DataSys+ Course Outline, Domain 5.0 Business Continuity, Objective 5.2 Given a scenario, implement backup and restoration of database management systems.
