## AD0-E605資格認定 & AD0-E605試験参考書

市場で最高のAD0-E605テストトレンドを提供する世界的なリーダーとして、GoShikenは、専門家によって何度もチェックされているAD0-E605試験問題の更新情報を提供することを約束し、消費者の大半が、統合サービスの構築に努めています。さらに、認定トレーニングアプリケーションだけでなく、インタラクティブな共有とアフターサービスでも画期的な成果を達成しました。AD0-E605トレーニングブレインダンプを購入する価値があります。

## Adobe Real-Time CDP Business Practitioner Professional 認定 AD0-E605 試験問題 (Q70-Q75):

### 質問 # 70

What components are critical for Profile Composition in Adobe RT-CDP? (Select two.)

- A. Identity stitching from multiple sources.
- B. Data governance enforcement.
- C. Attribute mapping across schemas.
- D. Audience segmentation at the edge.

正解: A、C

### 質問 # 71

Which process is crucial for creating a unified customer profile in Adobe Experience Platform?

- A. Employing a single data source to ensure consistency in the profile
- B. Restricting profile data to demographic attributes only to reduce complexity
- **C. Configuring Identity Graph to reconcile multiple identifiers across datasets**
- D. Using Adobe Real-time CDP to automatically update identities and preferences

正解: C

解説:

Creating a unified customer profile in Adobe Experience Platform (AEP) depends fundamentally on the Identity Service and its ability to bridge disparate data fragments. The crucial process is the configuration of the Identity Graph, which serves as a map of relationships between various identity namespaces (such as Email, CRM ID, and ECID) across different datasets. When data is ingested, the Identity Service looks for these identifiers; if two different records share a common identifier, the service links them together in the graph.

Without a properly configured Identity Graph, data remains siloed in its original datasets. For example, if a "Purchase" event from an offline system contains a CRM ID and a "Web Visit" event contains an ECID, the platform cannot know they belong to the same person unless a third record (perhaps a login event) connects the CRM ID to the ECID. Option A is incorrect because a unified profile requires both attributes and behavioral events to be useful. Option C defeats the purpose of a CDP, which is designed to integrate multiple sources. Option D is a result of the system's function but not the specific underlying process required to achieve unification. Therefore, reconciling identifiers through the Identity Graph is the technical foundation for the "Single View of the Customer."

#### 質問 # 72

A media and entertainment client wants to reduce the website latency by sending web event data to the Adobe Experience Platform Edge Network and then transfer the data to other Adobe products instead of leveraging individual product libraries. Which in-built field group in the schema configuration can help with the data collection on the Edge Network?

- A. Experience Event - Proposition Reference
- B. Journey Orchestration Step Event Action Execution Fields
- **C. Adobe Experience Platform Web SDK ExperienceEvent**
- D. Consumer Experience Event

正解: C

解説:

To reduce latency and consolidate data collection, Adobe recommends using the Adobe Experience Platform Web SDK. This single library replaces legacy tags (like AppMeasurement.js or at.js) and sends data to the Edge Network via a single call. For the Edge Network to correctly process this data and route it to Adobe Real-Time CDP, the underlying XDM ExperienceEvent schema must include the Adobe Experience Platform Web SDK ExperienceEvent field group.

This specific field group contains the standardized structures required to capture web-specific metadata, such as browser details, device information, and implementation context, which the Edge Network utilizes for server-side forwarding. Option A is a more general field group that lacks the specific plumbing for Web SDK automation. Option C is related to Journey Orchestration logic rather than raw data collection. Option D is used for Decision Management (Offers). By using the Web SDK field group, the client ensures that the data is structured in a "language" that the Edge Network understands natively, allowing for the sub-second data distribution required to reduce website overhead.

#### 質問 # 73

A data engineer has loaded a single order event with a status of "order\_placed" into the Real-Time Customer Profile. The event utilizes an Experience Event class-based schema/dataset where the email address is marked as the primary identity.

The event is as follows:

\_id: 1234 (unique id of the event)

timestamp: 2023-10-06T12:00:00Z (timestamp the event occurred)

Email: john.smith@somedomain.com (primary identity -- who the event belongs to)

status: order\_placed (status of the event)

A few hours later the data engineer sends an updated order event into the Real-Time Customer Profile stating the order status is now "order\_shipped".

The event is as follows:

\_id: 1234

timestamp: 2023-10-06T14:00:00Z

Email: john.smith@somedomain.com

status: order\_shipped

When the data engineer looks up the profile, the new event does not appear with the "order\_shipped" status on the profile, but it is in the Data Lake.

Why did this happen?

- A. The Real-Time Customer Profile skipped the record as the \_id was already existing.
- B. The Real-Time Customer Profile had a processing error during ingestion.
- C. The Real-Time Customer Profile only accepts one event per timestamp per primary identity.
- D. The Real-Time Customer Profile skipped the record as the timestamp was different.

正解: A

#### 質問 # 74

A data analyst needs to implement data governance in Adobe Real-Time CDP handling sensitive personal data and ensuring compliance with privacy regulations. What are the three most suitable actions to facilitate this process? (Choose three.)

- A. Assign data usage labels to all non-sensitive datasets
- B. Disable the ability to export personal data
- C. Apply data usage labels to sensitive datasets
- D. Start a privacy job request for sensitive datasets
- E. Enable stricter access control to sensitive datasets using RBAC and ABAC

正解: C、D、E

解説:

Implementing data governance for sensitive personal data in Adobe Real-Time CDP requires a multi-layered approach involving labeling, access control, and privacy management.

The first step is applying Data Usage Labels (Option D) to sensitive datasets. These labels (such as PII or Sensitive) allow the system to identify which data points are subject to specific privacy regulations and govern how they are activated to downstream destinations.

Secondly, stricter access control (Option E) must be implemented using Role-Based Access Control (RBAC) and Attribute-Based Access Control (ABAC). RBAC manages what a user can do (permissions), while ABAC manages what data a user can see based on labels applied to schemas and fields. This ensures that only authorized personnel can view or manipulate sensitive financial or personal records.

Finally, for ongoing compliance with regulations like GDPR or CCPA, the analyst must be able to process Privacy Job Requests (Option B). This involves using the Adobe Privacy Service to fulfill "Right to be Forgotten" or "Right to Access" requests by deleting or exporting specific profile data from the system.

Option A is counterproductive as non-sensitive data is rarely the priority for governance, and Option C is an over-restriction that would prevent legitimate business operations; instead, the platform uses policies to selectively restrict exports based on labels.

#### 質問 # 75

.....

AdobeのAD0-E605認定試験は現在で本当に人気がある試験ですね。まだこの試験の認定資格を取っていないあなたも試験を受ける予定があるのでしょうか。確かに、これは困難な試験です。しかし、難しいといっても、高い点数を取って楽に試験に合格できないというわけではないです。では、まだ試験に合格するショートカットがわからないあなたは、受験のテクニックを知りたいですか。今教えてあげますよ。GoShikenのAD0-E605問題集を利用することです。
