## Network Appliance NetApp Hardware Support Engineer Professional Exam Sample Questions (Q29-Q34):

### NEW QUESTION # 29

During a controller replacement procedure, the engineer notices that the replacement controller boots into Loader mode instead of ONTAP. Which action should be performed NEXT?

- A. Reassign all shelf IDs
- B. Verify environmental variables and boot parameters
- C. Immediately wipe all disks
- D. Replace every DIMM in the chassis

**Answer: B**

Explanation:

If a replacement controller stops at Loader mode, the engineer should first verify boot variables, environment settings, and correct

boot media configuration. Wiping disks or replacing DIMMs prematurely could introduce additional issues. Shelf IDs are unrelated to controller boot behavior and would not resolve Loader boot interruptions.

### NEW QUESTION # 30

When you plan an ONTAP upgrade, which NetApp tool generates a detailed upgrade plan?

- A. Active IQ Config Advisor
- B. ONTAP System Manager
- C. Active IQ Unified Manager
- **D. Upgrade Advisor**

**Answer: D**

Explanation:

The Upgrade Advisor is a NetApp tool that generates a detailed, step-by-step plan for upgrading an ONTAP system. This tool is available through the Active IQ portal and helps ensure a smooth and risk-free upgrade process.

Key Features of Upgrade Advisor:

Provides a tailored upgrade plan based on the current ONTAP version, cluster configuration, and desired target version.

Identifies potential risks, compatibility issues, and pre-requisite tasks for the upgrade. Offers detailed instructions for each stage of the upgrade process.

### NEW QUESTION # 31

A node has unexpectedly failed and is unresponsive through its node management interface.

Which two commands from the Service Processor are helpful to determine the root cause?

(Choose two.)

- A. sp status -d
- **B. event log show**
- C. system log
- **D. system core**

**Answer: B,D**

Explanation:

To determine the root cause of an unexpected node failure using the Service Processor (SP), the following commands are helpful:

1. event log show

What it does:

Displays recent events logged by the Service Processor. This includes hardware failures, environmental alerts, or other events that may have caused the node failure.

2. system core

What it does:

Shows information about any core dumps that were generated during the failure. A core dump provides a snapshot of the system state at the time of the failure, which can be analyzed to identify the root cause.

### NEW QUESTION # 32

Which type of AutoSupport message would you expect to see triggered automatically when ONTAP software detects a NetApp WAFL inconsistency on an aggregate?

- **A. WAFL INCONSISTENT BLOCK**
- B. WAFL INCONSISTENT USER DATA BLOCK
- C. MEDIUM ERROR DURING RECONSTRUCTION
- D. CHECKSUM ERROR

**Answer: A**

Explanation:

When ONTAP detects a WAFL inconsistency in an aggregate, it automatically generates an AutoSupport message with the description WAFL INCONSISTENT BLOCK.

Key Details:

WAFL INCONSISTENT BLOCK:

This error indicates that WAFL metadata or user data blocks have been found to be inconsistent.

ONTAP triggers an automatic AutoSupport message to notify administrators and NetApp Support.

### NEW QUESTION # 33

Which statement best describes the functionality of RAID Error Propagation (REP)?

- A. An unrecoverable error on a user data block triggers a NetApp WAFL inconsistency.
- B. A recoverable error on a user data block triggers a NetApp WAFL inconsistency.
- C. An unrecoverable error on a metadata block does not trigger a NetApp WAFL inconsistency.
- **D. An unrecoverable error on a user data block does not trigger a NetApp WAFL inconsistency.**

**Answer: D**

Explanation:

Functionality of RAID Error Propagation (REP):

RAID Error Propagation (REP) ensures that errors on the disk layer, such as unrecoverable read errors, do not propagate as inconsistencies into the WAFL (Write Anywhere File Layout) metadata layer.

WAFL is designed to manage data blocks, and if an error occurs on a user data block, WAFL can identify and handle it gracefully without flagging an inconsistency.

Why Option A Is Correct:

REP ensures that errors on a user data block are isolated and do not trigger WAFL inconsistencies.

Instead, the error is handled at the RAID layer or higher without corrupting metadata.

This design provides a robust mechanism to protect against data integrity issues caused by disk errors.
