CompTIA Server+ Certification Exam Sample Questions (Q51-Q56):

NEW QUESTION # 51

A new 40GB NIC has just been installed in a server but is not detected within the Windows server OS. Which of the following would most likely fix the issue?

- A. Update the switch firmware.
- B. Update the server OS.
- C. Update the firmware on the NIC.
- D. Update the remote management console.

Answer: C

Explanation:

Updating the firmware on the NIC is the most likely solution to fix the issue of a new 40GB NIC not being detected within the Windows server OS. Firmware is a software program that controls the functionality of a hardware device, such as a NIC (network interface card). A NIC is a device that enables network communication for a server by providing an interface between the server and the network cable or wireless connection. Updating the firmware on the NIC can improve its performance, compatibility, and stability with the server OS and network protocols. NEW QUESTION # 52

A server administrator wants to ensure a storage array can survive the failure of two drives without the loss of data. Which of the following RAID levels should the administrator choose?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: B

Explanation:

RAID 6 is a level of RAID that can survive the failure of two drives without the loss of data. RAID 6 uses block-level striping with two parity blocks distributed across all member disks. RAID 6 can tolerate two simultaneous drive failures and still provide data access and redundancy. RAID 0 is a level of RAID that uses striping without parity or mirroring, and offers no fault tolerance. RAID 0 cannot survive any drive failure without data loss. RAID 1 is a level of RAID that uses mirroring without parity or striping, and offers fault tolerance by duplicating data on two or more disks. RAID 1 can survive one drive failure without data loss, but not two. RAID 5 is a level of RAID that uses block-level striping with one parity block distributed across all member disks. RAID 5 can tolerate one drive failure without data loss, but not two. References: https://en.wikipedia.org/wiki/Standard_RAID_levels

NEW QUESTION # 53

A server in a remote datacenter is no longer responsive. Which of the following is the BEST solution to investigate this failure?

- A. A Secure Shell connection
- B. Remote desktop
- C. Access via a crash cart
- D. Out-of-band management

Answer: D

Explanation:

Out-of-band administration provides hardware-level remote access to a host without relying on the OS software running. Common solutions include Dell's iDRAC and HP's iLO; the server hardware must support this type of remote administration, and it must be configured with IP settings.

NEW QUESTION # 54

A server recently started sending error messages about running out of memory while in use. After a maintenance period during which more memory was added, the server is still unable to consistently remain powered on. Which of the following should the technician check first?

- A. Memory slots
- B. Memory speed

- C. Boot order
- **D. Memory compatibility**

Answer: D

Explanation:

When troubleshooting memory-related errors, it's essential to consider several key factors:

* **Memory Compatibility:** Memory modules must match the specifications supported by the motherboard (e.g., DDR4 vs. DDR5, ECC vs. non-ECC, buffered vs. unbuffered). Using incompatible RAM can cause boot failures, crashes, or instability.

* **Memory Speed:** While RAM speed mismatches can affect performance, they typically do not cause a server to fail to power on. Most systems automatically adjust to the slowest module.

* **Memory Slots:** Incorrect installation or damaged slots could be an issue, but the priority is to check compatibility first.

* **Boot Order:** This setting controls the sequence in which devices boot the OS, which is unrelated to memory-related power issues. Since the server remains unstable after adding memory, the most likely issue is an incompatibility with the motherboard. The first step is to verify whether the newly installed RAM meets the server's hardware requirements.
