CompTIA DataSys+ Certification Exam Sample Questions (Q141-Q146):

NEW QUESTION # 141
Which of the following qualifiers removes duplicate records from a SQL SELECT statement when included in a query?

- A. SINGLE
- B. UNIQUE
- C. TOP 1
- D. DISTINCT

Answer: D

NEW QUESTION # 142
An on-premises application server connects to a database in the cloud. Which of the following must be considered to ensure data integrity during transmission?

- A. Masking
- B. Encryption
- C. Redundancy
- D. Bandwidth

Answer: B

Explanation:
The factor that must be considered to ensure data integrity during transmission is encryption. Encryption is a process that transforms data into an unreadable or scrambled form using an algorithm and a key. Encryption helps protect data integrity during transmission by preventing unauthorized access or modification of data by third parties, such as hackers, eavesdroppers, or interceptors. Encryption also helps verify the identity and authenticity of the source and destination of the data using digital signatures or certificates. The other options are either not related or not sufficient for this purpose. For example, bandwidth is the amount of data that can be transmitted over a network in a given time; redundancy is the duplication of data or components to provide backup or alternative sources in case of failure; masking is a technique that replaces sensitive data with fictitious but realistic data to protect its

confidentiality or compliance. Reference: CompTIA DataSys+ Course Outline, Domain 4.0 Data and Database Security, Objective 4.2 Given a scenario, implement security controls for databases.

NEW QUESTION # 143

A database administrator should review the database disaster recovery documentation:

- A. just before an outside audit is scheduled.
- B. when the company's business requirements change.
- C. whenever a new Chief Technical Officer joins the company.
- D. during every first week of every month.

Answer: B

Explanation:
Disaster recovery documentation should be reviewed and updated whenever business requirements change to ensure recovery plans remain aligned with current needs.

NEW QUESTION # 144

Which of the following code snippets would allow a SQL injection?
var name;

- A. var SQL = "Select * from sample_database where name = ' " + name + " '
   " ;
- B. var name = "Select * from sample_database where name = ' " + name + " '
   " ;
   var name;
- C. name= request.form ("name");
   var name;
- D. name= request.form ("name");
   var SQL = "Select * from sample_database where name = ' " + name + " '
   " ;
   var name;

Answer: D

Explanation:
This code directly concatenates user input into an SQL query string without validation or parameterization, making it vulnerable to SQL injection attacks.

NEW QUESTION # 145

A database administrator is creating a table, which will contain customer data, for an online business. Which of the following SQL syntaxes should the administrator use to create an object?

- A. ☐
- B. ☐
- C. ☐
- D. ☐

Answer: A

Explanation:
The SQL syntax that the administrator should use to create an object is option B. This syntax uses the CREATE TABLE statement to define a new table named customer with four columns: customer_id, name, email, and phone. Each column has a data type and a constraint, such as NOT NULL or PRIMARY KEY. The other options either have syntax errors, use incorrect keywords, or do not specify the table name or columns correctly. Reference: CompTIA DataSys+ Course Outline, Domain 1.0 Database Fundamentals, Objective 1.1 Given a scenario, identify and apply database structure types.

NEW QUESTION # 146
