Reliable EMT Real Exam - EMT Questions Pdf

As you know that a lot of our new customers will doubt about our website or our EMT exam questions though we have engaged in this career for over ten years. So the trust and praise of the customers is what we most want. We will accompany you throughout the review process from the moment you buy EMT Real Exam. We will provide you with 24 hours of free online services to let you know that our EMT study materials are your best tool to pass the exam.

NREMT Emergency Medical Technicians Exam Sample Questions (Q63-

Q68):

NEW QUESTION # 63

A 10-year-old patient is in hypovolemic shock. Which of the following signs would be early indicators of shock for this patient? Select the three correct options.

- A. Blood pressure
- **B. Heart rate**
- C. Blood glucose level
- **D. Respiratory rate**
- E. SpO₂
- **F. Capillary refill**

Answer: B,D,F

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Children compensate for shock through increased heart rate, respiratory rate, and vasoconstriction, which delays blood pressure drop.

Therefore:

* Tachycardia is often the first sign

* Prolonged capillary refill (>2 seconds) is an early indicator

* Tachypnea supports perfusion

Blood pressure is a late sign in pediatric shock. SpO₂ is helpful but does not specifically indicate shock. Blood glucose may be abnormal in other metabolic conditions but is not an early marker of volume loss.

PALS Guidelines - Recognition of Shock in Children

AAOS Emergency Care and Transportation (11th ed.), Chapter: Pediatric Shock

NEW QUESTION # 64

Which of the following would potentially complicate patient care during a helicopter transport?

- A. Maintaining 98% oxygen saturation
- B. Increase in the atmospheric humidity
- **C. Position of the patient's head within the aircraft**
- D. Use of air splints to immobilize fractures

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The position of the patient's head within the aircraft affects access to airway management and crew maneuverability. If the head is oriented away from providers or toward a non-accessible bulkhead, this can delay critical interventions (airway suctioning, ventilations).

Use of air splints, maintaining oxygen saturation, or environmental humidity are not major complications relative to physical positioning and in-cabin access limitations.

NEW QUESTION # 65

During a mass casualty incident, a patient has an open tibia and fibula deformity. Using START triage, in which of the following priorities should the EMT place the patient?

- **A. Delayed**
- B. Immediate
- C. Emergent
- D. Minimal

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The START (Simple Triage and Rapid Treatment) system classifies patients based on ability to walk, respirations, perfusion, and mental status. A patient with an open fracture who can breathe adequately, has a pulse, and follows commands is categorized as "Delayed".

Immediate (Red) is reserved for those who cannot walk and have life-threatening conditions, such as compromised airway or severe bleeding.

FEMA MCI Guidelines

Brady Emergency Care (13th ed.) - Chapter on MCI and Incident Management

NEW QUESTION # 66

What are possible complications of using continuous positive airway pressure (CPAP)? Select the two correct options.

- A. Myocardial infarction
- **B. Feeling of suffocation**
- C. Bronchospasms
- D. Pulmonary edema
- **E. Hypotension**

Answer: B,E

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

CPAP works by delivering continuous positive pressure to keep alveoli open and improve oxygenation.

However, complications include:

* Hypotension: Due to reduced venous return and cardiac preload

* Feeling of suffocation: Common psychological reaction to a tight-fitting mask and forced airflow. It is used to treat, not cause, pulmonary edema. It does not induce bronchospasm or myocardial infarction.

National EMS Education Standards - Noninvasive Positive Pressure Ventilation AAOS EMT Textbook (11th ed.), CPAP and Respiratory Distress Management

NEW QUESTION # 67

A choking patient becomes unresponsive. What should the EMT perform next? Select the two correct options.

- A. Position the patient in recovery and administer back blows
- **B. Begin chest compressions**
- C. Do not ventilate until the foreign body is removed
- **D. Check for a pulse**
- E. Open the airway and look in the mouth

Answer: B,D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

If a choking patient becomes unresponsive, EMTs should:

* Check for a pulse

* Begin chest compressions if no pulse is found. Chest compressions can help dislodge the object. After compressions, the airway should be opened and inspected. Back blows are not appropriate for unconscious patients.

Ventilation is attempted after clearing the airway or if no object is seen. Do not withhold compressions waiting for object removal.
