100% Pass 2026 Trustable WGU Introduction-to-IT: New WGU Introduction to IT Exam Book

Our Introduction-to-IT exam questions boost 3 versions: PDF version, PC version, APP online version. You can choose the most suitable version of the Introduction-to-IT study guide to learn. Each version of Introduction-to-IT training prep boosts different characteristics and different using methods. For example, the APP online version of Introduction-to-IT Guide Torrent is used and designed based on the web browser and you can use it on any equipment with the browser. It boosts the functions of exam simulation, time-limited exam and correcting the mistakes.

WGU Introduction to IT Sample Questions (Q109-Q114):

NEW QUESTION # 109

Which item is an input device?

- A. Printer
- B. Flash Drive
- C. CD
- **D. Scanner**

Answer: D

Explanation:

An input device is any hardware device that sends data to a computer, allowing you to interact with and control it. Input devices enable users to input information into the computer system. Let's break down the options:

*Flash Drive (A): A flash drive (also known as a USB drive or thumb drive) is a storage device, not an input device. It allows you to store and transfer data but does not directly input data into the computer.

*CD (B): A CD (compact disc) is also a storage medium, typically used for storing audio, video, or software files. Like a flash drive, it is not an input device.

*Scanner : A scanner is a classic example of an input device. It captures physical documents, images, or text and converts them into digital data that the computer can process. Scanners are commonly used for tasks like digitizing photos, creating PDFs, or scanning documents.

*Printer (D): A printer is an output device, not an input device. It produces hard copies (printed documents) based on digital data received from the computer.

In summary, the correct answer is C. Scanner, as it directly inputs data into the computer system.

NEW QUESTION # 110

A person is preparing a pizza, which needs to be baked for 18 minutes at 400°F. Which component of the data- information- knowledge-wisdom DIKW hierarchy is exemplified by the value 18 in this scenario?

- A. Knowledge
- **B. Data**
- C. Information
- D. Wisdom

Answer: B

Explanation:

In the DIKW hierarchy, the value 18 by itself represents data because it is a raw numeric fact without meaning until it is connected to context. In Information Systems fundamentals, data is defined as unprocessed facts such as numbers, symbols, or measurements that do not explain their purpose on their own. The number

18 could represent many things: minutes, dollars, items, or a temperature reading. Once the number is connected to the statement baked for 18 minutes, it becomes information because the data has been given context and meaning. Knowledge would involve understanding how baking time interacts with oven type, pizza thickness, or cooking technique, and being able to apply that understanding to adjust cooking when conditions change. Wisdom would involve making the best overall decision, such as considering health, safety, and preventing burning based on real-world judgment. Since the question asks specifically about the value 18 in isolation, it matches the DIKW definition of data as a raw fact. Therefore, the correct answer is data.

NEW QUESTION # 111

Which type of network is used to connect wireless headphones to a smartphone?

- A. Wide area network WAN
- **B. Personal area network PAN**
- C. Extended area network EAN
- D. Local area network LAN

Answer: B

Explanation:

Wireless headphones typically connect to a smartphone using Bluetooth, which is an example of a personal area network. In Information Technology, a personal area network is a short-range network centered around an individual's devices, usually within a

few meters. PAN technology is designed for low power usage and convenient device pairing, making it ideal for accessories such as headphones, smartwatches, fitness trackers, and wireless keyboards. A local area network covers a larger area such as a home, office, or campus and commonly uses Ethernet or Wi-Fi to connect computers and network devices. A wide area network spans large geographic distances and connects networks across cities, countries, or continents, often using leased lines or internet infrastructure. Extended area network is not a standard category used in most networking fundamentals curricula compared with PAN, LAN, MAN, and WAN. Since the connection between headphones and a phone is short-range and personal, it is best classified as a personal area network.

Therefore, the correct answer is PAN.

NEW QUESTION # 112

What do IT professional organizations publish to offer morals by which individuals and companies abide?

- A. Bylaws
- B. Policies
- C. Ethics
- D. Regulations

Answer: C

Explanation:

IT professional organizations publish codes of ethics to provide moral guidance for individuals and organizations working in the technology field. In Information Technology, a code of ethics outlines principles and standards of conduct related to responsibilities such as protecting privacy, ensuring security, avoiding harm, maintaining professional competence, being honest about system capabilities, and respecting intellectual property. These ethical standards help professionals make responsible decisions, especially when technical choices can affect users, society, or critical infrastructure. Regulations are legal requirements issued by governments and enforced through law. Policies are internal rules set by organizations to guide behavior within a specific company or institution. Bylaws are governance rules that define how an organization operates, such as membership, elections, and leadership structure, but they do not primarily serve as moral guidance for the broader profession. Professional ethics documents, on the other hand, are meant to guide behavior across the industry and promote trust and accountability. Therefore, the correct answer is ethics.

NEW QUESTION # 113

What type of a system requirement involves preventing unauthorized access to data?

- A. Security
- B. Accessibility
- C. User needs
- D. Design

Answer: A

Explanation:

*Unauthorized access refers to gaining entry or access to a system, physical or electronic, without the permission of the owner or administrator.

*Security is the type of system requirement that involves preventing unauthorized access to data.

*Security measures include:

oAuthentication: Verifying user identity.

oEncryption: Protecting data from unauthorized viewing.

oAccess controls: Limiting who can access specific resources.

oFirewalls: Filtering network traffic.

*Ensuring security helps safeguard sensitive information and maintain data integrity.
