## B2B-Commerce-Developer Valid Exam Sample - B2B-Commerce-Developer Valid Exam Experience

It doesn't matter if it is the first time you participate in the online training or if you prepare this exam for some time. It is a simple and smart way to prepare the B2B-Commerce-Developer practice exam with our latest learning materials. There are free demo and valid questions and answers in our B2B-Commerce-Developer Pass Guide. If you spend some time and pay attention to B2B-Commerce-Developer test answers, there is no reason to not pass test and get the certification.

## Salesforce Accredited B2B Commerce Developer Sample Questions (Q140-Q145):

### NEW QUESTION # 140

Which three actions must a developer take, in a B2B Commerce store, to accept credit card payments using a client's chosen payment provider?

- A. Create a RegisteredExternalService record for the custom payment provider class.

- B. Create an Apex class that implements the `sfmc_checkout.PaymentGatewayAdapter`
- C. Create an Apex class that implements the `commercepayments.PaymentGatewayAdapter`.
- D. Create a named credential for authentication with the payment provider.
- E. Create a `PaymentProviderGateway` record for the custom payment provider class.

**Answer: B,D,E**

Explanation:

Three actions that a developer must take, in a B2B Commerce store, to accept credit card payments using a client's chosen payment provider are: create a named credential for authentication with the payment provider, create an Apex class that implements the `sfmc_checkout.PaymentGatewayAdapter` interface, and create a `PaymentProviderGateway` record for the custom payment provider class. Creating a named credential for authentication with the payment provider allows the developer to securely store and manage authentication information, such as username, password, token, or certificate, for connecting to the payment provider's API or service. Creating an Apex class that implements the `sfmc_checkout.PaymentGatewayAdapter` interface allows the developer to define custom logic for processing credit card payments using the payment provider's API or service. The interface provides methods for validating credit card information, authorizing payments, capturing payments, voiding payments, and refunding payments. Creating a `PaymentProviderGateway` record for the custom payment provider class allows the developer to register the custom payment provider class as a payment gateway in the store and associate it with a payment method. Creating a `RegisteredExternalService` record for the custom payment provider class is not a required action, as this is only used for registering external services that are not related to payment processing, such as tax or shipping services. Creating an Apex class that implements the `commercepayments.PaymentGatewayAdapter` interface is not a required action either, as this is only used for D2C Commerce stores, not B2B Commerce stores. Salesforce References: B2B Commerce Developer Guide: Payment Integration, B2B Commerce Developer Guide: Payment Gateway Adapter Interface, B2B Commerce Developer Guide: Payment Provider Gateway Object

#### NEW QUESTION # 141

The `ccUtil` apex class in Salesforce B2B Commerce provides numerous utility functions that can be leveraged in subscriber classes. What are two ways to check the input or return data of the Global API 's'? (2 answers)

- A. `ccrz.ccUtil.isEmpty(Map < String, Object > )` and `ccrz.ccUtil.isEmpty(List < Object > )`
- B. `ccrz.ccUtil.isNotEmpty(Map < String, Object > )` and `ccrz.ccUtil.isNotEmpty(List < Object > )`
- C. `ccrz.ccUtil.isValid(Map < String, Object > )` and `ccrz.ccUtil.isValid(List < Object > )`
- D. `ccrz.ccUtil.isNotValid(Map < String, Object > )` and `ccrz.ccUtil.isNotValid(List < Object > )`

**Answer: A,B**

Explanation:

The `ccUtil` apex class provides two methods to check the input or return data of the Global API's: `ccrz.ccUtil.isNotEmpty(Map < String, Object > )` and `ccrz.ccUtil.isEmpty(Map < String, Object > )`. These methods return true if the map is not null and contains at least one entry, or if the map is null or empty, respectively. Similarly, `ccrz.ccUtil.isNotEmpty(List < Object > )` and `ccrz.ccUtil.isEmpty(List < Object > )` return true if the list is not null and contains at least one element, or if the list is null or empty, respectively. These methods are useful for validating the input parameters or the output results of the Global API's.

#### NEW QUESTION # 142

Which two methods should a developer implement in a Lightning web component to successfully handle the subscription lifecycle of a Message Channel?

- A. `unsubscribe()`
- B. `stopListener()`
- C. `Subscribe()`
- D. `startListener()`

**Answer: A,C**

Explanation:

Explanation

To handle the subscription lifecycle of a message channel in a Lightning web component, the developer should implement the `subscribe()` and `unsubscribe()` methods from the `lightning/messageService` module.

The `subscribe()` method returns a subscription object that represents the connection to the message channel.

The developer can use this object to unsubscribe from the message channel later. The unsubscribe() method takes a subscription object as a parameter and removes the listener from the message channel. The developer should call the unsubscribe() method when the component is disconnected from the DOM, such as in the disconnectedCallback() lifecycle hook, to avoid memory leaks and performance issues.

The other options are not correct because:

\* B. stopListener() is not a valid method for handling the subscription lifecycle of a message channel.

There is no such method in the lightning/messageService module or the Lightning web component framework.

\* C. startListener() is not a valid method for handling the subscription lifecycle of a message channel.

There is no such method in the lightning/messageService module or the Lightning web component framework.

References:

\* Subscribe and Unsubscribe from a Message Channel

\* Lifecycle Hooks

\* Use message channel in both direction

### NEW QUESTION # 143

A configuration value, CO.NewOrder, is set to TRUE. What is one way of preventing an existing payment page from being shown on the checkout payment page?

- A. Delete the Visualforce page from the code base.
- B. Override the front end template and modify the way the embedded payment page gets loaded from the payment list configuration.
- C. Remove the value matching the page name from the pmr.whitelist configuration setting, then rebuild and activate a new Configuration cache
- D. Remove the payment type associated with the payment page from CO.pmts, then rebuild and activate a new cache.

**Answer: C**

### NEW QUESTION # 144

A developer needs to create an event listener on a parent component programmatically. With the script below, what should replace the text <EVENT\_LISTENER\_UNE>?

```
import { LightningComponent } from 'lwc';
export default class Parent extends LightningElement {
  constructor() {
    super();
    <EVENT_LISTENER_UNE>
  }
  handleNotification = () => {};
}
```

- A. this.template.addEventListener(handleNotification);
- B. this.template.addEventListener('notification', this.handleNotification);
- C. addEventListener('notification', this.handleNotification);
- D. this.template.addEventListener(this.handleNotification);

**Answer: B**

Explanation:

Explanation

To create an event listener on a parent component programmatically, the developer should use the following line of code: this.template.addEventListener('notification', this.handleNotification); This line of code adds an event listener to the template element of the parent component, which is the root element that contains all the child elements. The event listener listens for an event named 'notification', which is a custom event that can be dispatched by any child component. The event listener invokes a method named handleNotification, which is an arrow function defined in the parent component class. The handleNotification method receives the event object as a parameter and can perform any logic based on the event data. The other lines of code are either incorrect or incomplete. Salesforce References: Lightning Web Components Developer Guide: Communicate with Events, Lightning Web Components Developer Guide: Create and Dispatch Events

## NEW QUESTION # 145

.....

In order to adapt to different level differences in users, the B2B-Commerce-Developer exam questions at the time of writing teaching materials with a special focus on the text information expression, as little as possible the use of crude esoteric jargon, as much as possible by everyone can understand popular words to express some seem esoteric knowledge, so that more users through the B2B-Commerce-Developer Prep Guide to know that the main content of qualification examination, stimulate the learning enthusiasm of the user, arouse their interest in learning.
