ISTQB (ISTQB CTAL-TA) ISTQB Certified Tester Advanced Level - Test Analyst (Syllabus 2012) Sample Questions (Q21-Q26):

NEW QUESTION # 21
You have been asked to set up a session-based test management (SBTM) approach for exploratory testing on your current project.
Which of the options below describes a correct sequence of steps for the first exploratory test session?
SELECT ONE OPTION

- A. Create a test charter for the session to record the areas to be tested, run a time-boxed test execution session, hold a debriefing session to gather and discuss the results of the tests
- B. Run a debriefing session with the test manager to agree on the test procedures for the session, execute the test procedures, record the test results in a test charter
- C. Select existing test cases from the test management system most suitable for the session, copy them to a test charter, use a capture/replay tool to record the test execution session
- D. Document test ideas for the session in a test charter, execute the tests until all documented ideas have been tested, record the results of the tests in the test management system

Answer: A

Explanation:
Comprehensive and Detailed in Depth Explanation:
Session-Based Test Management (SBTM) for exploratory testing follows these steps:
* Test Charter Creation:To outline the goals and scope of the session.
* Time-Boxed Test Execution:Allows focused, exploratory testing within a fixed duration.
* Debriefing Session:To discuss findings, assess coverage, and review results.
Option D accurately reflects this structure, making it the correct answer.

NEW QUESTION # 22
You work for an insurance company with parallel projects. You need to recommend the best approach for test case design for each project.
* Project A:Maintenance release with minor UI changes, experienced testers, manual execution.
* Project B:Development of a new algorithm for risk assessment, high risk of regression, automation needed, audit required.
SELECT ONE OPTION

- A. Project A - Low level test cases. Project B - High level test cases
- B. Project A - Low level test cases. Project B - Low level test cases
- C. Project A - High level test cases. Project B - High level test cases
- D. Project A - High level test cases. Project B - Low level test cases

Answer: D

Explanation:
Comprehensive and Detailed in Depth Explanation:
* Project A:Since the maintenance release involves minor changes and experienced testers are manually executing test cases,high-level test casesare sufficient. These cases outline what to test without detailed steps.
* Project B:Developing an algorithm involves complex logic and requiresdetailed validation, solow- level test casesare essential.
They provide precise input, expected results, and detailed procedures, which are important fortest automation and audit compliance.
Therefore, the correct answer isA (Project A - High level test cases. Project B - Low level test cases).

NEW QUESTION # 23
Based on the tax system specification as described below, using boundary value analysis, which would be the best test set to explicitly test on single boundary value fully?
Tax system
A tax system needs to be updated due to new legislation. For a person with a salary of less than € 20 000 and who is married, the tax needs to be recalculated.
If a person has at least three and less than six children, an additional 10% reduction is applicable.

Test set (i)		
Civil Status	**Salary**	**Number of Children**
Married	€ 20.000	4
Not Married	€ 22.000	3
Married	€ 18.000	2

Test set (ii)		
Civil Status	**Salary**	**Number of Children**
Not Married	€ 19.000	8
Not Married	€ 20.000	4
Married	€ 50.000	4

Test set (iii)		
Civil Status	**Salary**	**Number of Children**
Married	€ 20.000	10
Not Married	€ 22.000	5
Not Married	€ 20.001	0

Test set (iv)		
Civil Status	**Salary**	**Number of Children**
Not Married	€ 22.000	1
Not Married	€ 18.000	2
Married	€ 18.000	10

- A. Test set (iv)
- B. Test set (ii)
- C. Test set (iii)
- D. Test set (i)

Answer: B

Explanation:
The test set B is the best test set to explicitly test on single boundary value fully, using boundary value analysis. Boundary value analysis is a technique that tests the values at or near the boundaries of an input domain. The boundaries for this scenario are:
* Salary less than €20 000
* Number of children at least three and less than six
The test set B tests the boundary values of each boundary (€19 999, €20 000, three children, six children) and one value inside each boundary (€19 998, €20 001, four children). Verified References: [ISTQB Certified Tester Advanced Level Test Analyst CTAL-TA], Section 3.2.2, page 35.

NEW QUESTION # 24

You are testing the processing of a critical traffic control system to which various regulations apply The processing of the input variables is dependent on defined ranges within which the actual retrieved data values can lie.
Which of the following black-box test techniques should you use to test the processing functionality of this system?

- A. Pairwise testing
- B. Equivalence partitioning enhanced with boundary value analysis
- C. State transition testing
- D. Use case testing

Answer: B

Explanation:
The best black-box test technique to test the processing functionality of this system is equivalence partitioning enhanced with boundary value analysis. Equivalence partitioning is a technique that divides the input domain into subdomains that are expected to behave similarly. Boundary value analysis is a technique that tests the values at or near the boundaries of an input domain. These

techniques are suitable for testing a system that depends on defined ranges of input variables, as they can ensure that all subdomains and boundary values are covered by test cases. NEW QUESTION # 25
Which of the following descriptions is an example of the use of defect taxonomies?

- A. Using a list of known defect types to penetrate the security of computer systems
- B. Following a defect management process throughout testing
- C. Grouping defects found during execution by functional area
- D. Running tests with the aim of finding as many defects as possible

Answer: A

Explanation:
The description that is an example of the use of defect taxonomies is using a list of known defect types to penetrate the security of computer systems. A defect taxonomy is a classification of defects based on their characteristics, causes, or effects. A defect taxonomy can be used to design test cases that target specific types of defects or vulnerabilities in a system or component.
