CompTIA A+ Certification Exam: Core 1 220-1101 Prüfungsfragen mit Lösungen (Q347-Q352):

347. Frage

A team is having issues with paper jams on a printer that the team shares with other teams. The team that is having issues prints legal-sized documents, and the other teams print letter-sized documents. Which of the following is most likely the issue?

- A. Page orientation
- **B. Tray settings**
- C. Worn rollers
- D. Multipage misfeed

Antwort: B

Begründung:
Explanation

The most likely issue is C. Tray settings.

Tray settings are the configuration options that tell the printer what size and type of paper is loaded in each tray. If the tray settings do not match the actual paper size and type, the printer may not be able to feed the paper correctly and cause paper jams.

In this scenario, the team that is having issues prints legal-sized documents, which are 8.5 x 14 inches, while the other teams print letter-sized documents, which are 8.5 x 11 inches. If the printer's tray settings are set to letter size by default, the printer may not recognize the legal-sized paper and try to pull it as if it were letter-sized paper. This can result in paper jams or misaligned printing. To fix this issue, the team should check and adjust the tray settings on the printer to match the paper size and type they are using. They can also use a separate tray for legal-sized paper and another tray for letter-sized paper, and make sure to select the correct tray when printing.

The other options are less likely to cause the issue, because:

*Worn rollers are the rubber parts that grip and move the paper through the printer. They can wear out over time and lose their traction, causing paper jams or misfeeds. However, worn rollers would affect all teams and all paper sizes, not just one team and one paper size.

*Page orientation is the direction of the paper, either portrait or landscape. It can affect how the document is printed on the paper, but not how the paper is fed into the printer. Page orientation can be changed in the print settings or in the document itself, but it would not cause paper jams unless the paper size is also incorrect.

*Multipage misfeed is when more than one sheet of paper is pulled into the printer at once, causing a jam. This can happen if the paper is too thin, too thick, or too slippery, or if there is too much or too little paper in the tray. However, multipage misfeed would also affect all teams and all paper sizes, not just one team and one paper size.

348. Frage

Which of the following provides the highest level of isolation from the host operating system?

- A. Single-node clustering
- B. Resource pooling
- C. Hardware-assisted virtualization
- **D. Type II hypervisor**

Antwort: D

Begründung:

A type II hypervisor is a software application that runs on top of a host operating system and creates virtual machines that are isolated from the host. A type II hypervisor provides the highest level of isolation from the host operating system because it does not have direct access to the hardware resources and relies on the host operating system for drivers and services. A type II hypervisor also allows the guest operating systems to run different types of operating systems than the host.

349. Frage

A user submits a help desk ticket regarding a smartphone that will no longer accept its charging cable. The assigned technician notices the phone does not have a protective case, and the user constantly transport the phone in a pocket. The technician attempts to use a secondary charger, but the cable falls out of the phone.

Which of the following is the MOST likely cause of the issue?

- **A. The charge port contains foreign objects, such as lint.**
- B. The phone requires a firmware update to address charging issues.
- C. The phone has experienced water damage, thus the battery is not charging.
- D. The phone's battery has swelled, preventing the utilization of the charge port.

Antwort: A

350. Frage

A user reports having an issue charging a laptop from home. When the user connects the USB-C adapter that is attached to the office workstation to the laptop charging port, the laptop charges correctly. When the user connects the home USB-C adapter to the laptop charging port, the laptop does not charge. Which of the following should the technician do to ensure the user can work at

home and in the office?

- A. Provide a UPS for the user's home office.
- **B. Give the user an OEM power supply for home use.**
- C. Instruct the user to use a USB-C hub when working at home.
- D. Replace the user's laptop with a desktop, and enable remote log-in.

Antwort: B

Begründung:

The issue described suggests that the home USB-C adapter may not be compatible with the laptop or may not meet the necessary power requirements to charge the device. Providing the user with an Original Equipment Manufacturer (OEM) power supply ensures compatibility and reliability, as OEM chargers are specifically designed to work with the laptop model in question.

This solution ensures that the user can work efficiently both at home and in the office without facing charging issues, as OEM power supplies adhere to the specific voltage and amperage requirements of the device.

351. Frage

While configuring a new network printer, a technician observes that the router cannot use a specific static IP address due to security restrictions. Which of the following should the technician use to ensure the printer always gets the same IP address even if the router is restarted?

- A. Lease
- B. Exclusion
- C. Scope
- **D. Reservation**

Antwort: D

Begründung:

When configuring a network device like a printer, assigning it a static IP address ensures that it always uses the same IP address. If a static IP cannot be set due to security restrictions, the next best solution is to configure a reservation in the DHCP (Dynamic Host Configuration Protocol) server. This reservation ensures that the device (in this case, the printer) always receives the same IP address based on its MAC address, even if the router restarts.

A . Reservation: A DHCP reservation ties a specific IP address to the MAC address of a device, ensuring it always receives the same IP address from the DHCP server.

Why the other options are incorrect:

B . Scope: A DHCP scope defines the range of IP addresses that can be assigned to devices. It doesn't ensure that a specific device always gets the same IP.

C . Lease: A lease refers to the length of time a device is assigned an IP address from the DHCP server. It doesn't guarantee that the same IP will be re-assigned after the lease expires.

D . Exclusion: An exclusion in DHCP configuration excludes specific IP addresses from being assigned dynamically. This is used to prevent certain addresses from being given out but doesn't ensure a device will always get the same IP.

This topic is covered under the Networking domain of the CompTIA A+ Core 1 exam.
