Salesforce Certified MuleSoft Developer II Sample Questions (Q15-Q20):

NEW QUESTION # 15

Refer to the exhibit.

What required changes can be made to give a partial successful response in case the United Airlines API returns with a timeout?

- A. Add Flow Reference components inside a Try scope.
Set the payload to a default value " inside the error handler using the ON Error Continue scope
- **B. Add a Scatter-Gather component inside a Try scope.**
Set the payload to a default value 'Error' inside the error handler using the On Error Continue scope.
- C. Add a Scatter-gather component inside a Try scope.
Set the payload to a default value 'Error' inside the error handler using the On Error Propagate scope.
- D. Add Flow Reference components inside a Try scope
Set the payload to a default value " inside the error handler using the On Error Propagate scope

Answer: B

Explanation:

To give a partial successful response in case the United Airlines API returns with a timeout, the developer should add a Scatter-Gather component inside a Try scope, and set the payload to a default value 'Error' inside the error handler using the On Error Continue scope. A Scatter-Gather component allows sending multiple requests concurrently and aggregating the responses into an array. A Try scope allows handling errors that occur within it using an error handler. An On Error Continue scope allows continuing the flow execution after handling an error. Therefore, by using these components, the developer can send requests to both APIs in parallel, handle any timeout errors from United Airlines API, and return a partial response with a default value for that API.

NEW QUESTION # 16

A system API that communicates to an underlying MySQL database is deploying to CloudHub. The DevOps team requires a readiness endpoint to monitor all system APIs.

Which strategy should be used to implement this endpoint?

- A. Create a dedicated endpoint that responds with the API status and health of the server
- B. Use an existing resource endpoint of the API
- C. Create a dedicated endpoint that responds with the API status only
- **D. Create a dedicated endpoint that responds with the API status and reachability of the underlying systems**

Answer: D

Explanation:

To implement a readiness endpoint to monitor all system APIs, the developer should create a dedicated endpoint that responds with the API status and reachability of the underlying systems. This way, the DevOps team can check if the system API is ready to receive requests and if it can communicate with its backend systems without errors. NEW QUESTION # 17

Which statement is true about using mutual TLS to secure an application?

- A. Mutual TLS ensures only authorized end users are allowed to access an endpoint
- B. Mutual TLS requires a hardware security module to be used
- C. Mutual TLS increases the encryption strength versus server-side TLS alone
- D. Mutual TLS authenticates the identity of the server before the identity of the client

Answer: D

Explanation:

Mutual TLS (mTLS) is an extension of TLS that requires both parties (client and server) to present their certificates to each other during the handshake process. This way, both parties can verify each other's identity and establish a secure connection. The authentication of the server happens before the authentication of the client, as the server sends its certificate first and then requests the client's certificate. NEW QUESTION # 18

A Mule implementation uses a HTTP Request within an Unit Successful scope to connect to an API.

How should a permanent error response like HTTP:UNAUTHORIZED be handle inside Until Successful to reduce latency?

- A. Configure retrying until a MULERETRY_EXHAUSTED error is raised or the API responds back with a successful response.
- B. Put the HTTP Request inside a try scope in Unit Successful.
In the error handler, use On Error Propagate to catch permanent errors like HTTP UNAUTHORIZED.
- C. In Until Successful configuration, set the retry count to 1 for error type HTTP: UNAUTHORIZED.
- D. Put the HTTP Request inside a try scope in Unit Successful.
In the error handler, use On Error Continue to catch permanent errors like HTTP UNAUTHORIZED.

Answer: D

Explanation:

To handle a permanent error response like HTTP:UNAUTHORIZED inside Until Successful, the developer should put the HTTP Request inside a try scope in Unit Successful, and use On Error Continue to catch permanent errors like HTTP UNAUTHORIZED in the error handler. This way, the developer can avoid retrying requests that will always fail due to a permanent error, and reduce latency. On Error Continue allows the flow to continue processing after handling the error. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/until-successful-scope> <https://docs.mulesoft.com/mule-runtime/4.3/on-error-continue-concept>

NEW QUESTION # 19
