Identity-and-Access-Management-Architect Exam is ideal for those who are looking to demonstrate their expertise in identity and access management within the Salesforce ecosystem.

## Salesforce Certified Identity and Access Management Architect Sample

## Questions (Q135-Q140):

### NEW QUESTION # 135

Northern Trail Outfitters (NTO) is planning to roll out a partner portal for its distributors using Experience Cloud. NTO would like to use an external identity provider (IdP) and for partners to register for access to the portal. Each partner should be allowed to register only once to avoid duplicate accounts with Salesforce.

What should a identity architect recommend to create partners?

- A. On successful creation of Partners using Self Registration page in Experience Cloud, create identity in Ping.
- B. Create a custom web page in the Portal and create users in the IdP and Experience Cloud using published APIs.
- C. Create a custom page in Experience Cloud to self register partner with Experience Cloud and Ping identity store.
- D. Allow partners to register through the IdP and create partner users in Salesforce through an API.

**Answer: C**

### NEW QUESTION # 136

In a typical SSL setup involving a trusted party and trusting party, what consideration should an Architect take into account when using digital certificates?

- A. Use of self-signed certificate leads to higher maintenance for trusting party because the cert needs to be added to their truststore.
- B. Use of self-signed certificate leads to lower maintenance for trusting party because there is no trusted CA cert to maintain.
- C. Use of self-signed certificate leads to lower maintenance for trusted party because multiple self-signed certs need to be maintained.
- D. Use of self-signed certificate leads to higher maintenance for trusted party because they have to act as the trusted CA

**Answer: A**

Explanation:

D is correct because using a self-signed certificate leads to higher maintenance for the trusting party, which is the client or browser that connects to the server. The trusting party needs to add the self-signed certificate to their truststore, which is a repository of trusted certificates, in order to establish a secure connection with the server. Otherwise, the trusting party will see a warning message or an error when accessing the server.

A is incorrect because using a self-signed certificate leads to higher maintenance for the trusted party, not lower. The trusted party needs to maintain multiple self-signed certificates from different servers in their truststore.

B is incorrect because using a self-signed certificate does not make the trusted party act as the trusted CA (Certificate Authority). The trusted CA is the entity that issues and validates certificates for servers. The trusted party only needs to trust the CA's root certificate, which is usually pre-installed in their truststore.

C is incorrect because using a self-signed certificate leads to higher maintenance for the trusting party, not lower. The trusting party still needs to maintain a trusted CA cert in their truststore, which is the self-signed certificate itself.

### NEW QUESTION # 137

What information does the 'Relaystate' parameter contain in sp-Initiated Single Sign-on?

- A. Reference to a URL redirect parameter at the identity provider.
- B. Reference to the login address URL of the service provider.
- C. Reference to the login address URL of the identity Provider.
- D. Reference to a URL redirect parameter at the service provider.

**Answer: D**

Explanation:

Explanation

The 'Relaystate' parameter is an HTTP parameter that can be included as part of the SAML request and SAML response. In an SP-initiated sign-in flow, the SP can set the RelayState parameter in the SAML request with additional information about the request, such as the URL of the resource that the user is trying to access.

The IDP should just relay it back in the SAML response without any modification or inspection. Therefore, the 'Relaystate' parameter contains a reference to a URL redirect parameter at the service provider<sup>123</sup>.

### NEW QUESTION # 138

Northern Trail Outfitters (NTO) wants to improve its engagement with existing customers to boost customer loyalty. To get a better understanding of its customers, NTO establishes a single customer view including their buying behaviors, channel preferences and purchasing history. All of this information exists but is spread across different systems and formats.

NTO has decided to use Salesforce as the platform to build a 360 degree view. The company already uses Microsoft Active Directory (AD) to manage its users and company assets.

What should an Identity Architect do to provision, deprovision and authenticate users?

- A. Salesforce Identity can be included but NTO will be required to build a custom integration with Microsoft AD.
- B. Salesforce Identity is not needed since NTO uses Microsoft AD.
- C. Salesforce Identity is included in the Salesforce licenses so it does not need to be considered separately.
- **D. A Salesforce Identity can be included but NTO will require Identity Connect.**

**Answer: D**

Explanation:

Identity Connect is a Salesforce product that integrates Microsoft Active Directory with Salesforce user records. It allows provisioning, deprovisioning, and authentication of users based on AD data. The other options are either incorrect or irrelevant for this use case. References: Get to Know Identity Connect, Identity Connect

### NEW QUESTION # 139

Northern Trail Outfitters manages functional group permissions in a custom security application supported by a relational database and a REST service layer. Group permissions are mapped as permission sets in Salesforce.

Which action should an identity architect use to ensure functional group permissions are reflected as permission set assignments?

- A. Use the Apex JIT handler to callout to the security application and set permission sets
- B. Use the Apex Just-in-Time (JIT) handler to query the Security Assertion markup Language (SAML) attributes and set permission sets.
- **C. Use a Login Flow with invocable Apex to callout to the security application and set permission sets.**
- D. Use a Login Flow to query SAML attributes and set permission sets.

**Answer: C**
