Salesforce Certified MuleSoft Integration Associate Exam Sample Questions (Q11-Q16):

NEW QUESTION # 11

During a planning session with the executive leadership, the development team director presents plans for a new API to expose the data in the company's order database. An earlier effort to build an API on top of this data failed, so the director is recommending a design-first approach.

Which characteristics of a design-first approach will help make this API successful?

- A. Publishing the fully implemented API to Exchange so all developers can reuse the API
- **B. Developing a specification so consumers can test before the implementation is built**
- C. Building MUnit tests so administrators can confirm code coverage percentage during deployment
- D. Adding global policies to the API so all developers automatically secure the implementation before coding anything

Answer: B

Explanation:

A design-first approach emphasizes creating the API specification before implementation, ensuring better alignment with consumer needs and reducing the risk of project failure. Here's a detailed explanation:

* API Specification:

* Definition: An API specification is a detailed, formal description of the API's endpoints, request/response formats, and protocols.

* Consumer Testing: Allows API consumers (developers) to understand, test, and provide feedback on the API design before actual development begins.

* Advantages:

* Early Feedback: Consumers can test the API design using mock services or tools like API Designer and provide feedback, ensuring the API meets their requirements.

* Reduced Rework: Identifies potential issues and design flaws early, reducing costly changes during the implementation phase.

* Documentation: Provides comprehensive documentation that aids in the development and future maintenance of the API.

NEW QUESTION # 12

An integration team follows MuleSoft's recommended approach to full lifecycle API development. Which activity should this team perform during the API implementation phase?

- A. Design the API specification
- **B. Use the API specification to build the MuleSoft application**
- C. Validate the API specification
- D. Use the API specification to monitor the MuleSoft application

Answer: B

Explanation:

MuleSoft recommends a full lifecycle API development approach which includes several phases such as design, implementation, testing, deployment, and management. During the API implementation phase, the primary activity is to use the API specification to build the MuleSoft application. Here's a detailed explanation:

* API Design:

* Create API Specification: Initially, an API specification is created using RAML or OAS (OpenAPI Specification) to define the API's structure, endpoints, request/response formats, and security requirements.

- * API Implementation:
 - * Build Mule Application: Using the API specification as a blueprint, the development team implements the MuleSoft application. This involves creating flows, integrating with backend systems, and ensuring the API functions as specified.
 - * APIKit: MuleSoft provides APIKit, a tool that automatically generates Mule flows based on the API specification, speeding up the development process.
 - * Testing: During implementation, unit tests (using MUnit) and integration tests are created to ensure the API behaves as expected.
 - * Validation and Monitoring:
 - * Validate Against Specification: Throughout the implementation phase, the API is continuously validated against the original specification to ensure compliance.
 - * Deployment and Monitoring: Post-implementation, the API is deployed, and tools like Anypoint Monitoring are used to monitor its performance and usage.

NEW QUESTION # 13

Which productivity advantage does Anypoint Platform have to both implement and manage an API?

- A. Automatic API semantic versioning
- **B. Automatic API proxy generation**
- C. Automatic API specification generation
- D. Automatic API governance

Answer: B

Explanation:

Anypoint Platform, MuleSoft's unified platform for API design and integration, offers several productivity advantages for both implementing and managing APIs. Among these features, automatic API proxy generation is particularly beneficial. Here's a step-by-step explanation:

* API Implementation:

* Design Center: In the Design Center, users can create API specifications using RAML or OAS.

This environment provides tools to design and document APIs effectively.

* Exchange: After defining the API, it can be published to Anypoint Exchange where it can be shared and discovered by others within the organization.

* Automatic API Proxy Generation:

* When an API is published to Exchange, Anypoint Platform allows for the automatic creation of an API proxy. An API proxy acts as a facade for your backend API, providing a layer of abstraction and security.

* Advantages:

* Security: Protects backend services by exposing only necessary endpoints and handling authentication, authorization, and rate limiting.

* Traffic Management: Helps in managing traffic through throttling and caching.

* Monitoring: Facilitates monitoring and logging to track API usage and performance.

* This automation saves time and reduces the complexity of manual proxy setup, allowing developers to focus on core business logic.

* API Management:

* API Manager: Provides a dashboard to manage API policies, versions, and SLA tiers. Users can apply security policies, monitor traffic, and analyze API usage.

* Monitoring: Integrated with Anypoint Monitoring, users get insights into API performance and health, enabling proactive management.

NEW QUESTION # 14

According to MuleSoft a synchronous invocation of a RESTful API using HTTP to get an individual customer record from a single system is an example of which system integration interaction pattern?

- A. One-way

- B. Request-Reply
- C. Multicast
- D. Batch

Answer: B

Explanation:

In system integration, different interaction patterns are used depending on the communication requirements between systems. For a synchronous invocation of a RESTful API using HTTP to get an individual customer record from a single system, the Request-Reply pattern is used. Here's a detailed explanation:

* Request-Reply Pattern:

* Definition: This pattern involves a client sending a request to a server and waiting for a reply.

The communication is synchronous, meaning the client waits for the server to process the request and send back the response.

* Typical Use Case: It is used when immediate feedback is required from the server, such as retrieving a specific customer record.

* RESTful API and HTTP:

* Synchronous Communication: HTTP is inherently synchronous, making it suitable for Request-Reply interactions where the client expects an immediate response.

* Data Retrieval: Commonly used for GET requests in RESTful APIs to retrieve data from a server.

* Example:

* Scenario: A client application requests customer details by making a GET request to a RESTful API endpoint. The server processes the request and returns the customer record.

NEW QUESTION # 15

An organization needs to procure an enterprise software system to increase cross-selling opportunities and better track prospect data.

Which category of enterprise software has these core capabilities, when used for its typical and intended purpose?

- A. Business-to-Business (B2B)
- B. Supply Chain Management (SCM)
- C. IT Service Management (ITSM)
- D. Customer Relationship Management (CRM)

Answer: D

Explanation:

Customer Relationship Management (CRM) systems are designed to manage an organization's interactions with current and potential customers. Here's a detailed explanation:

* Core Capabilities:

* Cross-Selling Opportunities: CRM systems track customer interactions, preferences, and purchasing history, helping businesses identify opportunities for cross-selling and upselling.

* Prospect Data Management: CRM systems manage prospect information, track leads, and nurture relationships through the sales funnel.

* Typical Use:

* Sales Management: Helps sales teams manage and analyze customer interactions and data throughout the customer lifecycle.

* Marketing Automation: Assists in automating marketing campaigns, segmenting customer lists, and tracking campaign effectiveness.

* Customer Service: Provides tools for managing customer support cases, improving customer satisfaction, and retaining customers.
