

# Get Real And Easy-to-Use Saviynt SCAIP Dumps PDF Format

Sav scenario

In Saviynt, the "Delta Fetch" configuration is used to return the delta number of records. This configuration ensures that only the changes (new, updated, or deleted records) are fetched rather than retrieving the entire dataset. It is typically implemented in the context of identity reconciliation or data synchronization to improve efficiency.

Key Configurations for Delta Fetch in Saviynt

- Delta Fetch in Reconciliation Jobs
  - Purpose: Fetches only the incremental changes from the source system since the last run.
  - Configuration Steps:
    - Navigate to Reconciliation Job Configuration in the Saviynt Admin Console.
    - Enable the Delta Fetch option.
    - Specify attributes like LastModifiedDate or a similar timestamp field in the source system to track changes.
    - Configure the Query Filter to fetch records modified after the last run.
- Key Attributes for Delta Fetch:
  - LastModifiedDate/UpdatedTimestamp: Tracks the most recent updates to records.
  - Status: Identifies records marked for deletion or deactivation.
- Delta Fetch in Connected Applications:
  - Supported connectors (e.g., Workday, Active Directory, or custom APIs) can use delta queries to fetch incremental changes by leveraging filters like lastModifiedDate > <timestamp>.

How Delta Fetch Works

- During the initial run, Saviynt fetches all records from the source system (full fetch).
- For subsequent runs, it retrieves only the records that have been created, updated, or deleted since the last reconciliation run.
- The system uses a reference timestamp or token stored from the previous job to determine what data to fetch.

Example Use Case

- Scenario: Reconciling user data from Active Directory.
- Configuration:
  - Use the whenChanged attribute in Active Directory as the delta filter.
  - Enable Delta Fetch in the job to ensure only recently modified users are retrieved.
- Result: Only users whose data has changed since the last sync will be fetched, optimizing performance.

Let me know if you need more detailed steps or use cases for configuring Delta Fetch in Saviynt!

Thus, it will allow you to examine the Saviynt SCAIP Dumps before purchasing it. Prep4away proudly presents the exceptional Saviynt SCAIP material that will meet your expectations. Beware that the sections of the exam change from time to time. Therefore, be alert by checking the updates frequently. It will prevent you from wasting time, material expenses, and inner peace.

## Saviynt SCAIP Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> <li>Access Reviews: This section covers the configuration and execution of access review campaigns across different reviewer types, along with campaign tracking and post-certification processes.</li> </ul>
Topic 2	<ul style="list-style-type: none"> <li>Access Request System: This section focuses on configuring and managing the end-to-end access request process, including workflows, approvals, and provisioning for both connected and disconnected applications.</li> </ul>
Topic 3	<ul style="list-style-type: none"> <li>Building Identity Warehouse: This section covers setting up the foundation of Saviynt by importing users, onboarding applications, and managing roles and access within the identity warehouse.</li> </ul>
Topic 4	<ul style="list-style-type: none"> <li>Analytics: This section focuses on building, configuring, and delivering reports, analytic controls, and dashboards to support data-driven identity governance decisions.</li> </ul>

## Saviynt SCAIP Reliable Dumps Sheet | New SCAIP Exam Pdf

Our top priority is to help every customer in cracking the Saviynt Certified Advanced IGA Professional (Level 200) (SCAIP) test. Therefore, we have created these formats so that every applicant can prepare successfully for the Saviynt Certified Advanced IGA Professional (Level 200) (SCAIP) exam on the first attempt. We are aware that the cost for the registration of the Saviynt SCAIP examination is not what everyone can pay. After paying the hefty Saviynt Certified Advanced IGA Professional (Level 200) (SCAIP) test registration fee, applicants usually run on a tight budget. This is why Prep4away provides you with the Saviynt Certified Advanced IGA Professional (Level 200) (SCAIP) real questions with up to 1 year of free updates.

### Saviynt Certified Advanced IGA Professional (Level 200) Sample Questions (Q12-Q17):

#### NEW QUESTION # 12

In REST connector, under which JSON do you specify the provisioning limit and connection timeout settings?

- A. MODIFYUSERDATAJSON
- B. ConnectionJSON
- C. ConfigJSON
- D. StatusthresholdConfig

**Answer: B**

Explanation:

In Saviynt EIC REST connector configuration, ConnectionJSON is the central configuration block where all connection-level properties are defined. This includes not only the base URL, authentication details, and headers, but also critical operational parameters such as connection timeout settings and provisioning limits (such as throttling or API limits).

Provisioning activities like account creation, update, and deletion rely on stable connectivity to the target system. Therefore, timeout configurations (for example, connection timeout and read timeout) are defined in ConnectionJSON to ensure that API calls do not hang indefinitely and can fail gracefully if the target system is unresponsive. Similarly, provisioning limits—such as maximum records processed or API throttling controls—are configured at this level to manage performance and avoid overloading external systems. Option A (ConfigJSON) is not a standard JSON used in REST connector configurations. Option B (MODIFYUSERDATAJSON) is used specifically for user update operations. Option D (StatusthresholdConfig) relates to job/status handling rather than connection parameters.

Thus, ConnectionJSON is the correct place for configuring provisioning limits and timeout settings in Saviynt REST connectors.

#### NEW QUESTION # 13

EIC is configured to create tickets in ServiceNow for requests for disconnected applications. The end user selects 3 different entitlements for a disconnected application and submits the request. How will EIC process this request?

- A. EIC will create three separate tickets in ServiceNow, one for each of the three entitlements
- B. If the "Enable Multi Entitlement Request" option is selected, then three tickets will be created in ServiceNow; otherwise, only one ticket will be created
- C. EIC will combine all three entitlements and create one ticket in ServiceNow
- D. Not a valid scenario because EIC does not support multiple entitlement requests when ServiceNow is integrated as the ticketing system

**Answer: B**

Explanation:

In Saviynt EIC when integrated with ServiceNow as a ticketing system (ITSM) for disconnected applications, ticket creation behavior depends on the configuration setting "Enable Multi Entitlement Request." If this option is enabled, Saviynt treats each entitlement independently and creates separate tickets in ServiceNow for each entitlement selected in the request. Therefore, if a user selects three entitlements, three individual tickets will be generated, allowing granular tracking and fulfillment of each entitlement.

If the option is not enabled, Saviynt consolidates multiple entitlements into a single request payload, resulting in one ServiceNow ticket that includes all requested entitlements. This approach simplifies ticket management but reduces granularity.

Option B is incorrect because Saviynt fully supports multiple entitlement requests with ServiceNow integration. Option C is only

conditionally correct (depends on configuration), making it incomplete. Option D is also conditional and not always true. Thus, the correct answer is A, as it accurately reflects the behavior based on system configuration.

#### NEW QUESTION # 14

Which statement correctly describes the two major ServiceNow integration modes supported by Saviynt?

- A. ServiceNow as a Managed Application is only for branding and labels; ServiceNow as a Ticketing System is only for analytics.
- B. ServiceNow as a Managed Application is used only for SAV roles; ServiceNow as a Ticketing System is used only for password sync.
- C. Both modes are the same and serve identical purposes.
- D. ServiceNow as a Managed Application supports import, provisioning, and deprovisioning; ServiceNow as a Ticketing System supports ticket-based ITSM integration.

**Answer: D**

Explanation:

The correct answer is A . Saviynt documentation describes two major ServiceNow integration models:

ServiceNow as a Managed Application and ServiceNow as a Ticketing System . The managed application model is used for application-style integration, including reconciliation or import and provisioning or deprovisioning activities. The ticketing system model is used when ServiceNow functions as the ITSM workflow and ticket platform connected to Saviynt request processing. This distinction is repeatedly emphasized in the ServiceNow integration overview documentation.

Saviynt further notes that integration with ServiceNow is required to perform reconciliation, provisioning, and deprovisioning tasks, and separately documents ServiceNow as a ticketing system for request-related use cases. That means the two modes are complementary but not identical. Option D is therefore wrong because the modes serve different architectural purposes. Options B and C are incorrect because branding, analytics- only usage, SAV-role-only usage, and password-sync-only behavior do not describe the documented ServiceNow integration patterns. For Level 200 exam preparation, this is a high-value distinction: choose Managed Application when ServiceNow is the governed target system, and Ticketing System when ServiceNow is the ITSM workflow engine around Saviynt processes

#### NEW QUESTION # 15

What are the different features available under Role Intelligence? (Multi-Select)

- A. Entitlement Discovery
- B. Role Governance
- C. Role Mining
- D. Role-Access Mismatches

**Answer: A,B,C**

Explanation:

In Saviynt EIC, Role Intelligence is a key component of Identity Governance that focuses on analyzing, optimizing, and managing roles effectively. It provides multiple features that help organizations improve role design and maintain compliance.

Role Governance (A) is a core feature that ensures roles are properly defined, reviewed, and certified. It helps maintain accountability and ensures that roles align with business policies.

Entitlement Discovery (B) enables identification and analysis of entitlements across applications, helping administrators understand what access exists and how it can be grouped into meaningful roles. This is essential for building accurate and efficient role models.

Role Mining (C) is one of the most important capabilities, allowing organizations to analyze user access patterns and automatically suggest roles based on common entitlement combinations. This improves role engineering and reduces manual effort.

Option D (Role-Access Mismatches) is not considered a standard feature under Role Intelligence; it is more aligned with analytics or audit findings rather than a core Role Intelligence function.

Therefore, the correct answers are A, B, and C, which represent the foundational features of Role Intelligence in Saviynt.

#### NEW QUESTION # 16

Which of the following statements are correct? (Multi-Select)

- A. The role mining process discovers relationships between users based on similar access permissions that can logically be

grouped to form a role

- B. Duplicate Identity Management can only merge user attributes but not user access
- C. In the Role mining, if the percentage cut-off = 60%, it would perform mining on only the access which is associated with 100% users
- D. Duplicate Identity Management feature access need to be added to the SAV Role to view the duplicate identity management

Answer: A,D

Explanation:

Statement A is correct because Role Mining in Saviynt analyzes user access patterns and identifies relationships between users who share similar entitlements. These patterns are then used to logically group access into roles, enabling efficient role-based access control (RBAC) implementation and reducing manual effort in role creation.

Statement B is incorrect because a percentage cut-off (e.g., 60%) in role mining means that entitlements common to at least 60% of users are considered for role creation-not 100%. The statement incorrectly interprets how threshold-based mining works.

Statement C is correct since access to Duplicate Identity Management (DIM) features is controlled via SAV Role configurations. Administrators must grant appropriate permissions within SAV roles to allow users to view and manage duplicate identities in the system.

Statement D is incorrect because DIM supports merging not only user attributes but also associated accounts and access depending on configuration. It is not limited to attributes alone.

Thus, the correct answers are A and C.

## NEW QUESTION # 17

.....

The Practice Exam software is specially made for the students so they can feel real-based examination scenarios and feel some pressure on their brains and don't feel excessive issues while giving the final Saviynt exam. There are a lot of customers that are currently using Saviynt Certified Advanced IGA Professional (Level 200) (SCAIP) and are satisfied with it. Prep4away has designed this product after getting positive feedback from professionals and is rated one of the best study materials for the preparation of the Saviynt SCAIP exam.
