Topic 6	<ul style="list-style-type: none"> Identify Dynamic User Roles and Segmentation: Covers how ClearPass assigns dynamic roles to users and devices to enforce network segmentation and access policies based on identity and context.

HPE Aruba Networking ClearPass Exam Sample Questions (Q33-Q38):

NEW QUESTION # 33

An IT administrator is setting up a network for a multinational company with multiple sites. They need to ensure that requests to different Active Directory servers are properly filtered. How should the administrator configure the network to meet this need?

- A. Use a single Network Device Group for all sites and filter requests by IP address.
- B. Rely on the default settings of the Active Directory servers for request filtering.
- C. Create multiple Network Device Groups and filter requests by belongs to group.

Answer: C

Explanation:

The administrator should create multiple Network Device Groups and configure ClearPass to filter requests using the "belongs to group" condition. This setup ensures that authentication requests from each site are directed to the correct Active Directory server, maintaining proper segmentation and efficient authentication handling across multiple locations.

NEW QUESTION # 34

An IT administrator is setting up a captive portal for a company's network and needs to ensure that the SSL certificate is compatible with the Aruba Instant device they are using. Which type of certificate should the administrator install to meet this requirement?

- A. DER certificate
- B. PEM certificate
- C. CER certificate

Answer: B

NEW QUESTION # 35

An IT administrator attempts to join a ClearPass server to an Active Directory domain. They notice that the system clocks of the ClearPass server and the AD domain are not in sync. The ClearPass server is 10 minutes behind the AD domain. What will be the likely outcome of this attempt to join the domain?

- A. The join will fail because Active Directory only allows a maximum of five minutes of clock skew.
- B. The join will succeed because ClearPass automatically adjusts the clock skew during the join process.
- C. The join will succeed but ClearPass will generate a warning about the clock skew.

Answer: A

Explanation:

The domain join will fail because Active Directory enforces a maximum allowable clock skew of five minutes between systems for Kerberos authentication. Since the ClearPass server is 10 minutes behind, the Kerberos ticket validation will fail, preventing the join operation.

NEW QUESTION # 36

What will ClearPass do if the 'Override OCSP URL from Client' option is unchecked and the certificate includes an OCSP URL?

- **A. ClearPass will use the OCSP URL included in the certificate.**
- B. ClearPass will use the OCSP URL from the authentication method.
- C. ClearPass will prompt the user for a valid OCSP URL.

Answer: A

Explanation:

Comprehensive and Detailed Explanation From HPE Aruba Networking ClearPass portfolio:

OCSP (Online Certificate Status Protocol) is used to check if a certificate has been revoked. By default, most certificates contain an "Authority Information Access" (AIA) field that points to the CA's OCSP responder. If the 'Override' option is unchecked, ClearPass follows standard PKI behavior and uses the specific URL embedded within the client's certificate to verify its status.

NEW QUESTION # 37

Why is it important to monitor system health and performance metrics in ClearPass?

Response:

- A. To validate user certificate authenticity
- B. To troubleshoot network segmentation
- **C. To proactively detect issues and ensure optimal service delivery**
- D. To automatically create enforcement profiles

Answer: C

NEW QUESTION # 38

.....
