Deep-Security-Professional Valid Exam Fee | Knowledge Deep-Security-Professional Points

Though there are three versions of our Deep-Security-Professional exam braindumps: the PDF, Software and APP online. When

using the APP version for the first time, you need to ensure that the network is unblocked, and then our Deep-Security-Professional guide questions will be automatically cached. The network is no longer needed the next time you use it. You can choose any version of our Deep-Security-Professional Practice Engine that best suits your situation. It's all for you to learn better.

Trend Micro Certified Professional for Deep Security is a certification exam that focuses on validating the skills and knowledge of IT professionals in securing virtual and cloud environments. It is designed for individuals who want to demonstrate their expertise in implementing, managing, and troubleshooting Trend Micro Deep Security solutions. Deep-Security-Professional Exam is administered by Trend Micro, a leading provider of cybersecurity solutions, and is recognized globally as a benchmark for excellence in deep security.

Trend Micro Certified Professional for Deep Security Sample Questions (Q58-Q63):

NEW QUESTION # 58

Which of the following are valid methods for forwarding Event information from Deep Security? Select all that apply.

- A. Simple Network Management Protocol (SNMP)
- B. Amazon Simple Notification Service (SNS)
- C. Security Information and Event Management (SIEM)
- D. Deep Security Application Programming Interface (API)

Answer: A,B,C

Explanation:

Deep Security supports forwarding event information through SNMP traps, integration with SIEM systems, and retrieval via the Deep Security API. While Amazon SNS is not a native forwarding method for Deep Security events, the others are fully supported and configurable from the Deep Security Manager.

SNMP allows sending traps for specific alert types.

API provides programmatic access to events.

SIEM forwarding is supported via syslog or direct integration.

NEW QUESTION # 59

A Recommendation Scan is run to determine which Intrusion Prevention rules are appropriate for a Server.

The scan is configured to apply the suggested rules automatically and ongoing scans are enabled. Some time later, an operating system patch is applied. How can you determine which Intrusion Prevention rules are no longer needed on this Server?

- A. Since the rules are being applied automatically, when the next Intrusion Prevention Recommendation Scan is run automatically, any rules that are no longer needed will be automatically unassigned. These are rules that are no longer needed as the vulnerability was corrected with the patch.
- B. The README file provided with the software patch will indicate which issues were addressed with this release. Compare this list to the rules that are applied to determine which rules are no longer needed and can be disabled.
- C. Since there is no performance effect when multiple Intrusion Prevention rules are applied, there is no need to determine which rules are no longer needed. The original recommended rules can remain in place without affecting the system.
- D. Since the rules are being applied automatically, when the next Intrusion Prevention Recommendation Scan is run automatically, any rules that are no longer needed will be displayed on the Recommended for Unassignment tab in the IPS Rules. These are rules that are no longer needed and can be disabled as the vulnerability was corrected with the patch.

Answer: C

Explanation:

When ongoing Recommendation Scans are enabled, Deep Security regularly reassesses the server's vulnerabilities based on its current patch level. If an OS patch addresses a previously detected vulnerability, the next Recommendation Scan will recognize this and recommend that the now-unnecessary IPS rules be unassigned. These rules appear in the "Recommended for Unassignment" tab, making it easy for administrators to review and unassign rules that are no longer needed.

From the official documentation:

"After an operating system or application is patched, running another Recommendation Scan will update the list of vulnerabilities and may move some IPS rules to the 'Recommended for Unassignment' tab. These rules can then be reviewed and unassigned to maintain optimal protection." Option B is incorrect because rules are not unassigned automatically; admin review is required.

Option A is manual and outside Deep Security's automated workflow.

The first option C is not correct; excessive rules may impact performance and management.

NEW QUESTION # 60

Where does Deep Security Manager store the credentials it uses to access the database?

- A. In the logging.properties file
- B. In the Windows Registry
- C. In the database.properties file
- **D. In the dsm.properties file**

Answer: D

NEW QUESTION # 61

The details for an event are displayed in the exhibit. Based on these details, which Protection Module generated the event?
