EMC Dell PowerStore Deploy 2023 Exam Sample Questions (Q42-Q47):

NEW QUESTION # 42

What does setting the alert threshold to 0 (zero) do when configuring replication rules?

- A. Generates an alert if the data saved during the RPO cycle exceeds 20% of the storage object capacity
- B. Disables all alerts for any missed RPO cycles.
- C. Generates an alert if the synchronization time exceeds the RPO.
- D. Enables alerts if the RPO cycle was missed for three consecutive cycles.

Answer: C

Explanation:

Here's a breakdown of how the alert threshold works in PowerStore replication:

RPO (Recovery Point Objective): The RPO defines the maximum acceptable amount of data loss in case of a disaster. It essentially determines how often data is replicated. For example, an RPO of 1 hour means you're willing to lose up to 1 hour's worth of data.

Alert Threshold: This setting allows you to control when PowerStore generates an alert if replication isn't meeting the defined RPO. It's the amount of time the system waits before raising an alert when a replication session fails to meet the RPO.

Threshold 0: When you set the alert threshold to 0, it means that PowerStore will immediately generate an alert if the synchronization time for a replication session takes longer than the RPO. This provides immediate notification of potential issues with replication performance or network connectivity.

Why other options are incorrect:

A . Disables all alerts for any missed RPO cycles: This is incorrect. Setting the threshold to 0 actually makes the system more sensitive to missed RPOs.

B . Generates an alert if the data saved during the RPO cycle exceeds 20% of the storage object capacity: This is not related to the alert threshold setting.

C . Enables alerts if the RPO cycle was missed for three consecutive cycles: The alert threshold doesn't have a built-in mechanism for consecutive missed cycles. It triggers an alert based on the synchronization time exceeding the RPO.

By setting the alert threshold to 0, you ensure that you're immediately notified of any replication delays, allowing you to take corrective action to prevent potential data loss.
