### SAP Certified Associate - Integration Developer Sample Questions (Q15-Q20):

#### NEW QUESTION # 15

You use an APIKey for authentication in an HTTPS API call. In which part of the Content Modifier is the APIKey included?

- A. Message header
- B. Attachment
- C. Message body
- D. Exchange property

#### Answer: A

Explanation:

To use an API key for authentication in an HTTPS API call, you must include the API key in the message header of the content modifier step. The message header contains information related to the message, such as addressing, routing, or metadata. You can use the content modifier step to create or modify message headers using expressions or constants. The API key is typically passed as a value of a specific header field, such as Authorization or X-API-Key, depending on the API provider's requirements. You can use the Camel Simple Expression Language to access or construct the API key value from variables, properties, or system information. #### NEW QUESTION # 16

You are creating an API proxy. Which of the following is a valid path prefix?

- A. /soap/opu/odata
- B. /sap/odu/odata
- C. /sap/opo/odata
- D. /sap/opu/odata

#### Answer: D

Explanation:

In SAP systems (e.g., S/4HANA, SAP Gateway), OData services follow a standard URL path:

/sap/opu/odata # The valid and official prefix for OData services.

Example: /sap/opu/odata/sap/API\_BUSINESS\_PARTNER

Other options:

/sap/opo/odata and /sap/odu/odata # Typographical variations, not valid.

/soap/opu/odata # Incorrect, since OData is not SOAP-based.  
Thus, the valid prefix is /sap/opu/odata.

### NEW QUESTION # 17

You are using a Data store Operation of the type Write. Which parameter must you select to avoid duplicate entries?

- A. Include Message Headers
- B. Retention Threshold for Alerting
- C. Overwrite Existing Message
- D. Encrypted stored Message

**Answer: C**

Explanation:

To avoid duplicate entries when using a Data Store Operation of the type Write, you must select the Overwrite Existing Message parameter. The Overwrite Existing Message parameter allows you to overwrite an existing data store entry with the same key if it already exists. If you do not select this parameter, the Write operation will fail if there is a duplicate key in the data store. Reference: Modernize Integration with SAP Integration Suite | openSAP

### NEW QUESTION # 18

During development, in which integration flow component can you configure a simulated payload?

- A. General Splitter
- B. Data Store Operations
- C. SOAP Adapter
- D. Content Modifier

**Answer: D**

Explanation:

In SAP Cloud Integration, during development and testing:

The Content Modifier can be used to insert or simulate payloads, headers, or properties.

This allows developers to test flows without requiring external calls.

Other options:

SOAP Adapter # Used for SOAP communication, not payload simulation.

General Splitter # Splits incoming payloads, doesn't simulate.

Data Store Operations # Manages stored messages, not simulation.

Thus, the correct component for simulated payloads is Content Modifier.

### NEW QUESTION # 19

Which SAP Integration Suite component delivers the Cloud Event to the "emis-s4hana-uc123" message queue?

- A. Process Integration
- B. Open Connector
- C. API Management
- D. Event Mesh

**Answer: D**

Explanation:

In SAP Integration Suite, the component responsible for delivering Cloud Events to message queues is Event Mesh. Event Mesh handles event-driven communication and manages message queues like emis-s4hana-uc123.

Process Integration (PI/PO) is on-premise middleware, not part of Integration Suite cloud services.

API Management handles APIs, not messaging events.

Open Connectors provides connectivity to third-party SaaS apps, not queue management.

Thus, the Cloud Event is delivered to the message queue via Event Mesh.
