Our Development-Lifecycle-and-Deployment-Architect study materials are willing to stand by your side and provide attentive service, and to meet the majority of customers, we sincerely recommend our Development-Lifecycle-and-Deployment-Architect practice guide to all customers, for our rich experience and excellent service are more than you can imagine. Here are several advantages of Development-Lifecycle-and-Deployment-Architect training guide for your reference: we have free demos for you to download before payment, and we offer one year free updates of our Development-Lifecycle-and-Deployment-Architect exam questions after payment and so on.

Achieving Salesforce Development-Lifecycle-and-Deployment-Architect Certification demonstrates a deep understanding of the Salesforce development lifecycle and deployment architecture, and the ability to design and deploy secure, scalable, and high-performance solutions on the platform. It is a valuable credential for professionals who want to advance their careers in Salesforce development and architecture and can help them stand out in a competitive job market.

Salesforce Development-Lifecycle-and-Deployment-Architect certification exam is a valuable credential for professionals who want to demonstrate their expertise in Salesforce development, deployment, and lifecycle management. Salesforce Certified Development Lifecycle and Deployment Architect certification exam is designed to test the candidate's knowledge and proficiency in various areas of Salesforce development lifecycle and deployment. Candidates who pass this certification exam can enhance their career prospects and demonstrate their commitment to professional development in the Salesforce ecosystem.

Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q170-Q175):

NEW QUESTION # 170

Product owners at Universal Containers want to ensure that all the requirements have test cases associated with them so that no functionality is left untested during user acceptance testing.

What project artifact can help meet the needs of the business?

- A. Testing strategy
- B. Test execution plan
- C. User acceptance test scripts
- **D. Requirement traceability matrix**

Answer: D

Explanation:

Explanation

A requirement traceability matrix is a project artifact that maps each requirement to its corresponding test cases, ensuring that all requirements are covered by testing. User acceptance test scripts are the actual steps to execute the test cases, not the artifact that links them to the requirements. Testing strategy and test execution plan are high-level documents that describe the overall approach and schedule for testing, not the specific mapping of requirements and test cases.

NEW QUESTION # 171

What are three advantages of the package development model?

Choose 3 answers

- **A. Improving team development and collaboration.**
- B. Providing its own source control, so the source can be deployed In any sandbox orgs.
- **C. Significantly reducing the need for manually tracking changes.**
- **D. Facilitating automated testing and continuous integration.**
- E. Eliminating the need of using change set, which should no longer be used as it can get messy working with package development models.

Answer: A,C,D

Explanation:

The advantages of the package development model are improving team development and collaboration, facilitating automated testing and continuous integration, and significantly reducing the need for manually tracking changes. The package development model allows the developers to work on modular and reusable components that can be easily tested and deployed. The package development model does not eliminate the need of using change sets, as they can still be used for deploying non-packaged components or metadata. The package development model does not provide its own source control, but rather relies on external source control systems such as Git.

NEW QUESTION # 172

What sandbox type would be appropriate for diagnosing reports of poor performance when accessing certain Visualforce pages?

- A. Developer Pro Sandbox.
- B. Partial copy Sandbox.
- C. Developer Sandbox.
- **D. Full Sandbox**

Answer: D

NEW QUESTION # 173

Universal Containers (UC) has many different business units, all requesting new projects to be built into a single Salesforce Org. UC management is concerned with a lack of appropriate project properties and roadmap for the Salesforce ecosystem. What should an Architect recommend?

- A. Create a Release Management Process.
- **B. Create a Center of Excellence with a charter document.**
- C. Create project charters for each project.
- D. Use design Standards for Governance.

Answer: B

Explanation:

Creating a Center of Excellence with a charter document is a recommended practice for managing multiple projects and aligning them with the business goals and roadmap. A Center of Excellence is a cross-functional team that provides guidance, support, and governance for the Salesforce ecosystem. A charter document defines the vision, mission, roles, and responsibilities of the Center of Excellence.

NEW QUESTION # 174

The CEO at Universal Containers (UC) is receiving constant complaints from business stakeholders that the development teams are not frequently delivering value to the end-user. The CEO talked with the CTO, who argues the opposite, explaining that the development teams are delivering value every Sprint.

The architect suggests to the CTO to implement Kanban to solve this disagreement.

How can Kanban help clarify whether value is being delivered to the business?

- **A. Kanban traits includes metrics, like lead time and throughput, which increases transparency.**
- B. Kanban can make use of the Salesforce Agile Accelerator to speed up delivery.
- C. Kanban teams respond to unplanned work and changes by dropping everything and jumping on the new request, ensuring agility.
- D. Kanban limits work in progress, so the executives will know the development team is not overworked.

Answer: A

Explanation:

Kanban can help clarify whether value is being delivered to the business by using metrics, like lead time and throughput, which increase transparency. Lead time measures how long it takes to complete a work item from the time it is requested, and throughput measures how many work items are completed in a given time period.

These metrics can help the business stakeholders see the progress and performance of the development teams, and align their expectations with the reality. Kanban does not respond to unplanned work and changes by dropping everything and jumping on the new request, as this would disrupt the flow and quality of work.

Kanban does not make use of the Salesforce Agile Accelerator, as this is a tool for managing agile projects.

Kanban does limit work in progress, but this is not the main reason why it can help clarify whether value is being delivered to the business.
