Development-Lifecycle-and-Deployment-Architect Valid Exam Tips, Development-Lifecycle-and-Deployment-Architect Study Test

Moreover, you do not need an active internet connection to utilize PassSureExam desktop Salesforce Development-Lifecycle-and-Deployment-Architect practice exam software. It works without the internet after software installation on Windows computers. The PassSureExam web-based Salesforce Development-Lifecycle-and-Deployment-Architect Practice Test requires an active internet and it is compatible with all operating systems.

Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q72-Q77):

NEW QUESTION # 72

Universal Containers (UC) is considering updating their Salesforce Release Management process. Which three best practices should UC consider for Release Management? Choose 3 answers

- A. Publish a release calendar for each phase of the release.
- B. Maintain a pre/post deployment checklist for each release.
- C. Design the right sandbox strategy for the release.
- D. Regression testing is mandatory for each release.
- E. Release sign-off is only required for Production.

Answer: B,C,D

Explanation:

Explanation

Designing the right sandbox strategy for the release is a best practice, as it helps to ensure the quality and consistency of the code/configuration across different environments. Regression testing is mandatory for each release, as it helps to verify that the existing functionality is not broken by the new changes. Maintaining a pre/post deployment checklist for each release is a best practice, as it helps to track the tasks and dependencies for each deployment. Release sign-off is not only required for Production, but also for other environments such as UAT and Staging. Publishing a release calendar for each phase of the release is not a best practice, as it may change due to unforeseen circumstances and create confusion.

NEW QUESTION # 73

UC's scale of Salesforce deployment has increased over time, leading to complexities. UC is finding too many bugs in the deployed code, which has become a challenge to the delivery team. The team wants to reduce the amount of bugs by ensuring all the developed code is reviewed, tested, and validated in the upstream deployment process. Which three development practices will be best suited to address UC's concerns? Choose

3

- A. Encourage the development team to be self-organizing.
- **B. Use continuous integration with automation testing.**
- C. Enable a short and timely feedback loop with customers
- **D. Incorporate test-driven deployment into the project structure.**
- **E. Enable developer teams to do peer code review.**

Answer: B,D,E

Explanation:

Explanation

Using continuous integration with automation testing is a development practice that will help to reduce the amount of bugs, as it allows the code to be built and tested frequently and automatically. Encouraging the development team to do peer code review is a development practice that will help to reduce the amount of bugs, as it allows the code to be checked and improved by other developers. Incorporating test-driven development into the project structure is a development practice that will help to reduce the amount of bugs, as it requires the developers to write tests before writing code and ensure that the code meets the test criteria. Enabling the development team to be self-organizing is not a development practice that will help to reduce the amount of bugs, as it does not directly affect the quality of the code. Enabling a short and timely feedback loop with customers is not a development practice that will help to reduce the amount of bugs, as it does not directly affect the quality of the code.

NEW QUESTION # 74

Universal Containers has five development teams. The performance of the teams has been good, but the number of bugs has been increasing. After each sprint, they need more time to understand the code and make changes.

What are two ways to improve the performance?

Choose 2 answers

- A. Define a team that will analyze/approve all changes.
- B. Version control system to identify who is generating the bugs.
- **C. Sprint review process.**
- **D. Define and follow code standards.**

Answer: C,D

Explanation:

Explanation

To improve the performance of the development teams, the following ways can be suggested: Define and follow code standards, and implement a sprint review process. Code standards can help ensure consistency, readability, and maintainability of the code, as well as reduce errors and bugs. A sprint review process can help evaluate the work done in each sprint, demonstrate the functionality, and gather feedback from the stakeholders and users.

NEW QUESTION # 75

Universal Containers are using Salesforce for Order Management and has integrated with an in-house ERP system for order

fulfillment. There is an urgent requirement to include a new order status value from the ERP system in the Order Status pick list in Salesforce. Which are two considerations when addressing the above requirement? Choose 2 answers

- **A. Implement the change in the sandbox, validate, and release to Production.**
- **B. Integration with the ERP system may not function as expected.**
- C. The change can be performed in Production, as it is a configuration change.
- D. Existing Apex test classes may start failing in Production.

Answer: A,B

Explanation:

Explanation

Implementing the change in the sandbox, validating, and releasing to production and considering that the integration with the ERP system may not function as expected are two considerations when addressing the requirement. The change should be performed in the sandbox first, as it is a best practice to test any changes in a non-production environment before deploying them to production. The change may also affect the integration with the ERP system, as it may require updating the mappings, validations, or transformations between the two systems.

NEW QUESTION # 76

UniversalContainers (UC) is using custom metadata types to control the behavior of a few of the custom functionalities. UC wants to Deploy custom metadata types to production using Metadata API.

Which two data types does UC need to include?

Choose 2 answers

- **A. CustomMetadata**
- B. CustomMetadataType
- **C. CustomField**
- D. CustomObject

Answer: A,C

Explanation:

To deploy custom metadata types to production using Metadata API, you need to include the CustomMetadata and CustomField data types. CustomMetadata represents the custom metadata type definition, and CustomField represents the custom metadata type fields. CustomMetadataType and CustomObject are not valid data types for custom metadata types

NEW QUESTION # 77

.....

We have the Development-Lifecycle-and-Deployment-Architect bootcamp , it aims at helping you increase the pass rate , the pass rate of our company is 98%, we can ensure that you can pass the exam by using the Development-Lifecycle-and-Deployment-Architect bootcamp. We have knowledge point as well as the answers to help you finish the training materials, if you like, it also has the offline version, so that you can continue the study at anytime
