## Questions (Q75-Q80):

### NEW QUESTION # 75

A team has exceeded their error budget by 10% in a particular month.

Give an example of what should happen next as a consequence.

- A. The error budget is ignored in subsequent months as it is creating the wrong kind of behavior
- B. The Error Budget is extended for another month to determine if this breach was an anomaly
- C. The Error Budget is reviewed to determine if it was realistic for the product or timeline
- D. Sprint planning may only pull post-mortem action items from the backlog

### Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

When a team exceeds its error budget, SRE practice requires applying error budget policies that restrict feature releases and shift focus toward reliability improvement. The idea is to prevent further degradation of user experience and ensure the service meets the agreed reliability targets.

The Site Reliability Engineering Book, Chapter "Service Level Objectives," states:

"If the service exceeds its error budget, all new feature launches or risky changes are halted until reliability returns to acceptable levels. Engineering work should be directed toward addressing the causes of the budget overrun." This aligns with option A, which describes a reliability-focused response during sprint planning. Limiting sprint planning to post-mortem action items and reliability improvements is a direct application of error budget policies.

Additional guidance from the SRE Workbook:

"Error budget burn should directly influence decision-making. When the budget is exhausted, the team must focus on remediation work rather than new features." Why the other options are incorrect:

- \* B Reviewing the error budget's realism can be done periodically, but it is not the immediate consequence of a breach.
- \* C Extending the error budget invalidates its purpose and is discouraged.
- \* D Ignoring the error budget contradicts the entire SRE model and Google's official guidance.

Therefore, A is the only correct answer.

### NEW QUESTION # 76

Engineering operational work to scale with a growing application is BEST achieved by addressing which of the following issues?

- A. Staffing levels
- B. Toil
- C. Interruptions
- D. On-call rotations

### Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

One of the central goals of SRE is that operational work must scale sublinearly with service growth. The SRE Book states: "If operational load grows linearly with service size, the model is unsustainable. Eliminating toil is key to scaling operations." (SRE Book - Chapter: Eliminating Toil). Toil prevents scaling because it is manual, repetitive, and tied directly to human effort.

Option C is the only answer that reflects this principle: reducing or eliminating toil enables SRE teams to support growing applications without increasing human labor proportionally.

Option A (staffing levels) does not scale sustainably.

Option B (interruptions) relate to productivity but not true scalability.

Option D (on-call rotations) affects fatigue, not the scaling of operational work.

Thus, C is the correct and SRE-authentic answer.

### NEW QUESTION # 77

Reliability is a key pillar of digital experience monitoring and incident management.

Which of the following describes the BEST type of reliability monitoring strategy in SRE?

- A. A strategy that uses traditional and familiar monitoring tools rather than advanced artificial intelligence
- B. A strategy that harnesses advanced technologies to measure, analyze, and maintain the fitness of applications
- C. A strategy that focuses on monitoring and discovering useful patterns in the performance of all active networks
- D. A strategy that instruments observability and provides monitoring insights across all components and layers

**Answer: D**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

SRE defines effective monitoring as comprehensive observability across all layers of a system, including latency, traffic, errors, saturation, dependencies, and infrastructure. The SRE Book states: "Monitoring must offer insight across all system components, enabling teams to rapidly detect and diagnose issues." (SRE Book

- Monitoring Distributed Systems). Observability instrumentation (logs, metrics, traces) provides the necessary depth for reliable digital experience monitoring.

Option B captures this exactly: broad observability across all components and layers.

Option A rejects modern observability practices-contradicting SRE guidance.

Option C is too narrow (network-only).

Option D focuses only on advanced technologies, not comprehensive coverage.

Thus, B is the best answer.

### NEW QUESTION # 78

Which of the following BEST defines a Service Level Indicator (SLI)?

- A. A subjective measure of the consequences if the level of service is not achieved
- B. A subjective assessment of the performance aspects of the level of service required
- C. A quantitative measure of some aspect of the level of service that is provided
- D. A quantitative target value for aspects of the level of service that are provided

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Google's definition is explicit: "An SLI is a carefully defined QUANTITATIVE measure of some aspect of the level of service provided." (SRE Book - Chapter: Service Level Objectives). Examples include error rate, latency, throughput, and availability. SLIs are measurements, not targets-targets are SLOs.

Option D repeats Google's definition almost exactly.

Option C incorrectly describes an SLO (a target), not an SLI.

Options A and B mention subjective assessments-SRE explicitly rejects subjectivity in measurement, stating: "SLIs must be objective and measurable." Thus, D is the correct and SRE-authentic answer.

### NEW QUESTION # 79

Which of the following BEST defines the golden signal for errors?

- A. The percent of capacity used by your system for current requests
- B. The rate of failed requests either explicitly or implicitly, or by policy
- C. The time it takes to service successful as well as failed requests
- D. The demand that is placed on your system by me volume of requests

**Answer: B**
