Before taking the exam, candidates must have completed the B2B Commerce Developer training and have at least six months of experience in implementing B2B commerce solutions.

Salesforce Accredited B2B Commerce Developer Sample Questions (Q179-Q184):

NEW QUESTION # 179

Where is the API-based record creation generally handled in Salesforce B2B Commerce?

- A. The service-layer responsible for the entity
- B. In the methods available in extension hooks
- C. Logic classes that implement the businesslogic for create operations
- D. Data creation is not allowed

Answer: A

Explanation:

The API-based record creation is generally handled in the service-layer responsible for the entity in Salesforce B2B Commerce. The service-layer is a set of classes that provide methods for interacting with the data layer and performing business logic. Each entity, such as product, cart, or order, has a corresponding service class that handles the create, read, update, and delete operations for that entity. For example, `ccrz.ccServiceProduct` provides methods for creating and retrieving products. Salesforce References: B2B Commerce and D2C Commerce Developer Guide, Service Classes

NEW QUESTION # 180

Which wire adapter should a developer use to retrieve metadata about a specific object?

- A. `getObjectDescribe`
- B. `getObject`
- C. `getObjectInfo`
- D. `getObjectMetadata`

Answer: C

Explanation:

To retrieve metadata about a specific object, a developer should use the `getObjectInfo` wire adapter. The `getObjectInfo` wire adapter imports data from the `@salesforce/schema` module and returns an object that contains information such as the object's label, key prefix, fields, child relationships, record type infos, and theme. The `getObjectMetadata` wire adapter does not exist. The `getObject` wire adapter does not retrieve metadata, but rather returns a record object based on the record ID. The `getObjectDescribe` wire adapter does not exist either. Salesforce References: [Lightning Web Components Developer Guide: `getObjectInfo`], [Lightning Web Components Developer Guide: Import Salesforce Schema]

NEW QUESTION # 181

During checkout flow customizations, a developer receives an error on shipping cost calculation integrations with the error code: `INSUFFICIENT_ACCESS_OR_READONLY`.

What is causing this error?

- A. The storefront user does not have access to the Cart Delivery Method object.
- B. The storefront user does not have access to custom fields on the Order Delivery Method object.
- C. An error has occurred during the cart shipping charge integration.
- D. The cart is no longer in a valid Checkout State.

Answer: D

Explanation:

Explanation

The error code `INSUFFICIENT_ACCESS_OR_READONLY` is caused by the cart being no longer in a valid Checkout State during checkout flow customizations. A cart is an object that represents a collection of products and charges that a customer intends to purchase in the storefront. A cart has a Checkout State field that indicates the current state of the checkout process for the cart. The Checkout State can have values such as Draft, InProgress, Completed, or Cancelled. A cart can only be modified or updated when it is in Draft or InProgress state. A cart cannot be modified or updated when it is in Completed or Cancelled state. If an attempt is made to modify or update a cart that is in Completed or Cancelled state, an error with the code `INSUFFICIENT_ACCESS_OR_READONLY` will be thrown. This error means that the user does not have permission to edit or delete a record because it is read-only or locked. The storefront user does not have access to the Cart Delivery Method object is not a cause of this error code, as it is not related to the cart checkout state or data modification. The Cart Delivery Method object is an object that stores information about the delivery method selected for a cart in the storefront. An error has occurred during the cart shipping charge integration is not a cause of this error code either, as it is not related to the cart checkout state or data modification. The cart shipping charge integration is an integration that calculates and applies shipping charges to a cart based on various factors such as delivery method, location, weight, volume, etc. The storefront user does not have access to custom fields on the Order Delivery Method object is not a cause of this error code either, as it is not related to the cart checkout state or data modification. The Order Delivery Method object is an object that stores information about the delivery method selected for an order summary in the storefront. Salesforce References: B2B Commerce Developer Guide: Cart Object, [B2B Commerce Developer Guide: Cart Delivery Method Object], [B2B Commerce Developer Guide: Order Delivery Method Object], [Salesforce Help: Common Error Messages]

NEW QUESTION # 182

Which service method should be overridden in order to allow "without sharing" queries?

- A. `ccrz.ccService.initSVCDAO()`
- B. `ccrz.ccService.query()`
- C. `ccrz.ccAPI.queryService()`
- D. `ccrz.ccService.queryWithoutSharing()`

Answer: A

NEW QUESTION # 183

How are variables bound when services use the `ccServiceDao` class to execute queries?

- A. Apex class variables
- B. Global variables
- C. Apex local variables
- D. String substitution

Answer: D

Explanation:

When services use the `ccServiceDao` class to execute queries, variables are bound by string substitution. This means that the query string contains placeholders for variables that are replaced by their values at runtime. For example, `ccrz.ccServiceDao.executeQuery('SELECT Id FROM Account WHERE Name = :name ')` will replace :name with the value of the name variable.
