Cisco Designing Cisco Enterprise Wireless Networks Sample Questions (Q88-Q93):

NEW QUESTION # 88

An engineer is designing a wireless deployment for a university auditorium. Which two features can be used to help deal with the issues introduced by high AP count? (Choose two.)

- A. LSS
- B. TPC
- C. RXSOP
- D. DFS
- E. TSPEC

Answer: B,C

Explanation:

RXSOP (Receive Start of Packet Detection Threshold) and TPC (Transmit Power Control) are two features that can help manage the challenges associated with a high AP (Access Point) count in a dense environment like a university auditorium. RXSOP can be adjusted to refine how APs differentiate between noise and valid packets, which is particularly useful in high-density areas where multiple APs might otherwise respond to the same signal. TPC helps in managing the transmit power of APs, allowing for better coverage and reduced interference among APs that are in close proximity to each other. NEW QUESTION # 89

An engineer is designing a point-to-multipoint mesh network. Which two AP configurations must be completed for a site survey? (Choose two.)

- A. MAP hostnames
- B. bridge group name
- C. Tx power
- D. mesh on 2.4 GHz band
- E. Rx power

Answer: C,E

Explanation:

For a point-to-multipoint mesh network site survey, configuring the Rx power and Tx power is essential. Rx power will determine the sensitivity of the AP to incoming signals, which is crucial for understanding the reach of each mesh point. Tx power settings will influence the strength of the signals transmitted from the AP, affecting the network's overall coverage.
