

Valid MLS-C01 Dumps - Exam MLS-C01 Assessment

The image shows a graphic with the Amazon Dumps logo at the top right. Below it, the text 'Exam Info' is centered. Underneath is a table with exam details. At the bottom, there are four links: 'MLS-C01 Exam Syllabus', 'MLS-C01 Question Answer', 'MLS-C01 Exam Questions', and 'MLS-C01 PDF Guide'.

Exam Type	Specialty
Exam duration	170 minutes
Exam cost	300\$
Question Type	Multiple Choice And Multiple Response
Exam Code	MLS-C01

2026 Latest DumpsKing MLS-C01 PDF Dumps and MLS-C01 Exam Engine Free Share: <https://drive.google.com/open?id=12Tp3WRWSVzTjFKKhRV8I1S6UNXJufE>

365 days free upgrades are provided by Amazon MLS-C01 exam dumps you purchased change. To avoid confusion, get the Amazon MLS-C01 practice exam and start studying. To guarantee success on the first try, subject matter experts have created all of the Amazon MLS-C01 Exam Material.

To prepare for the AWS-Certified-Machine-Learning-Specialty exam, candidates are advised to take online courses, read books, and practice with sample questions. Amazon provides a range of training materials and resources to help candidates prepare for the exam. Candidates can also find a range of third-party resources, including study guides, practice exams, and online courses, to help them prepare for the exam.

Exam Amazon MLS-C01 Assessment, Test MLS-C01 Dumps Demo

Amazon MLS-C01 certification exam is among those popular IT certifications. It is also the dream of ambitious IT professionals. This part of the candidates need to be fully prepared to allow them to get the highest score in the MLS-C01 Exam, make their own configuration files compatible with market demand.

Amazon AWS-Certified-Machine-Learning-Specialty (AWS Certified Machine Learning - Specialty) Exam is a certification program designed to validate the skills and knowledge of individuals in the field of machine learning. MLS-C01 Exam is intended for experienced practitioners who have a deep understanding of the core principles and best practices of machine learning. It is also ideal for those who are interested in pursuing a career in machine learning and want to demonstrate their expertise to potential employers.

Amazon AWS Certified Machine Learning - Specialty Sample Questions (Q176-Q181):

NEW QUESTION # 176

An insurance company is developing a new device for vehicles that uses a camera to observe drivers' behavior and alert them when they appear distracted. The company created approximately 10,000 training images in a controlled environment that a Machine Learning Specialist will use to train and evaluate machine learning models. During the model evaluation, the Specialist notices that the training error rate diminishes faster as the number of epochs increases and the model is not accurately inferring on the unseen test images. Which of the following should be used to resolve this issue? (Select TWO)

- A. Add L2 regularization to the model
- B. Perform data augmentation on the training data
- C. Make the neural network architecture complex.
- D. Use gradient checking in the model
- E. Add vanishing gradient to the model

Answer: A,B

Explanation:

The issue described in the question is a sign of overfitting, which is a common problem in machine learning when the model learns the noise and details of the training data too well and fails to generalize to new and unseen data. Overfitting can result in a low training error rate but a high test error rate, which indicates poor performance and validity of the model. There are several techniques that can be used to prevent or reduce overfitting, such as data augmentation and regularization.

Data augmentation is a technique that applies various transformations to the original training data, such as rotation, scaling, cropping, flipping, adding noise, changing brightness, etc., to create new and diverse data samples. Data augmentation can increase the size and diversity of the training data, which can help the model learn more features and patterns and reduce the variance of the model. Data augmentation is especially useful for image data, as it can simulate different scenarios and perspectives that the model may encounter in real life. For example, in the question, the device uses a camera to observe drivers' behavior, so data augmentation can help the model deal with different lighting conditions, angles, distances, etc. Data augmentation can be done using various libraries and frameworks, such as TensorFlow, PyTorch, Keras, OpenCV, etc.¹² Regularization is a technique that adds a penalty term to the model's objective function, which is typically based on the model's parameters. Regularization can reduce the complexity and flexibility of the model, which can prevent overfitting by avoiding learning the noise and details of the training data. Regularization can also improve the stability and robustness of the model, as it can reduce the sensitivity of the model to small fluctuations in the data. There are different types of regularization, such as L1, L2, dropout, etc., but they all have the same goal of reducing overfitting. L2 regularization, also known as weight decay or ridge regression, is one of the most common and effective regularization techniques. L2 regularization adds the squared norm of the model's parameters multiplied by a regularization parameter (λ) to the model's objective function. L2 regularization can shrink the model's parameters towards zero, which can reduce the variance of the model and improve the generalization ability of the model. L2 regularization can be implemented using various libraries and frameworks, such as TensorFlow, PyTorch, Keras, Scikit-learn, etc.³⁴ The other options are not valid or relevant for resolving the issue of overfitting. Adding vanishing gradient to the model is not a technique, but a problem that occurs when the gradient of the model's objective function becomes very small and the model stops learning. Making the neural network architecture complex is not a solution, but a possible cause of overfitting, as a complex model can have more parameters and more flexibility to fit the training data too well. Using gradient checking in the model is not a technique, but a debugging method that verifies the correctness of the gradient computation in the model. Gradient checking is not related to overfitting, but to the implementation of the model.

NEW QUESTION # 177

A Data Scientist needs to create a serverless ingestion and analytics solution for high-velocity, real-time streaming data.

The ingestion process must buffer and convert incoming records from JSON to a query-optimized, columnar format without data loss. The output datastore must be highly available, and Analysts must be able to run SQL queries against the data and connect to existing business intelligence dashboards.

Which solution should the Data Scientist build to satisfy the requirements?

- A. Create a schema in the AWS Glue Data Catalog of the incoming data format. Use an Amazon Kinesis Data Firehose delivery stream to stream the data and transform the data to Apache Parquet or ORC format using the AWS Glue Data Catalog before delivering to Amazon S3. Have the Analysts query the data directly from Amazon S3 using Amazon Athena, and connect to BI tools using the Athena Java Database Connectivity (JDBC) connector.
- B. Write each JSON record to a staging location in Amazon S3. Use the S3 Put event to trigger an AWS Lambda function that transforms the data into Apache Parquet or ORC format and writes the data to a processed data location in Amazon S3. Have the Analysts query the data directly from Amazon S3 using Amazon Athena, and connect to BI tools using the Athena Java Database Connectivity (JDBC) connector.
- C. Write each JSON record to a staging location in Amazon S3. Use the S3 Put event to trigger an AWS Lambda function that transforms the data into Apache Parquet or ORC format and inserts it into an Amazon RDS PostgreSQL database. Have the Analysts query and run dashboards from the RDS database.
- **D. Use Amazon Kinesis Data Analytics to ingest the streaming data and perform real-time SQL queries to convert the records to Apache Parquet before delivering to Amazon S3. Have the Analysts query the data directly from Amazon S3 using Amazon Athena and connect to BI tools using the Athena Java Database Connectivity (JDBC) connector.**

Answer: D

NEW QUESTION # 178

A company is using Amazon Polly to translate plaintext documents to speech for automated company announcements. However, company acronyms are being mispronounced in the current documents. How should a Machine Learning Specialist address this issue for future documents?

- A. Output speech marks to guide in pronunciation
- B. Convert current documents to SSML with pronunciation tags
- C. Use Amazon Lex to preprocess the text files for pronunciation
- **D. Create an appropriate pronunciation lexicon.**

Answer: D

Explanation:

A pronunciation lexicon is a file that defines how words or phrases should be pronounced by Amazon Polly. A lexicon can help customize the speech output for words that are uncommon, foreign, or have multiple pronunciations. A lexicon must conform to the Pronunciation Lexicon Specification (PLS) standard and can be stored in an AWS region using the Amazon Polly API. To use a lexicon for synthesizing speech, the lexicon name must be specified in the <say-as> SSML tag. For example, the following lexicon defines how to pronounce the acronym W3C:

```
<lexicon version="1.0" xmlns="http://www.w3.org/2005/01/pronunciation-lexicon" alphabet="ipa" xml:lang="en-US"> <lexeme>
<grapheme>W3C</grapheme> <alias>World Wide Web Consortium</alias> </lexeme> </lexicon>
```

To use this lexicon, the text input must include the following SSML tag:

```
<say-as version="1.1" xmlns="http://www.w3.org/2001/10/synthesis" xml:lang="en-US"> <voice name="Joanna"> <lexicon
name="w3c_lexicon"/> The <say-as interpret-as="characters">W3C</say-as> is an international community that develops open
standards to ensure the long-term growth of the Web. </voice> </say-as>
```

References:

Customize pronunciation using lexicons in Amazon Polly: A blog post that explains how to use lexicons for creating custom pronunciations.

Managing Lexicons: A documentation page that describes how to store and retrieve lexicons using the Amazon Polly API.

NEW QUESTION # 179

A Marketing Manager at a pet insurance company plans to launch a targeted marketing campaign on social media to acquire new customers. Currently, the company has the following data in Amazon Aurora:

- * Profiles for all past and existing customers
- * Profiles for all past and existing insured pets
- * Policy-level information
- * Premiums received
- * Claims paid

What steps should be taken to implement a machine learning model to identify potential new customers on social media?

- A. Use regression on customer profile data to understand key characteristics of consumer segments. Find similar profiles on social media
- **B. Use a recommendation engine on customer profile data to understand key characteristics of consumer segments. Find similar profiles on social media.**
- C. Use clustering on customer profile data to understand key characteristics of consumer segments. Find similar profiles on social media
- D. Use a decision tree classifier engine on customer profile data to understand key characteristics of consumer segments. Find similar profiles on social media.

Answer: B

NEW QUESTION # 180

A Machine Learning Specialist is working with a large cybersecurity company that manages security events in real time for companies around the world. The cybersecurity company wants to design a solution that will allow it to use machine learning to score malicious events as anomalies on the data as it is being ingested. The company also wants to be able to save the results in its data lake for later processing and analysis.

What is the MOST efficient way to accomplish these tasks?

- **A. Ingest the data into Apache Spark Streaming using Amazon EMR, and use Spark MLlib with k-means to perform anomaly detection. Then store the results in an Apache Hadoop Distributed File System (HDFS) using Amazon EMR with a replication factor of three as the data lake.**
- B. Ingest the data and store it in Amazon S3. Use AWS Batch along with the AWS Deep Learning AMIs to train a k-means model using TensorFlow on the data in Amazon S3.
- C. Ingest the data using Amazon Kinesis Data Firehose, and use Amazon Kinesis Data Analytics Random Cut Forest (RCF) for anomaly detection. Then use Kinesis Data Firehose to stream the results to Amazon S3.
- D. Ingest the data and store it in Amazon S3. Have an AWS Glue job that is triggered on demand transform the new data.

Then use the built-in Random Cut Forest (RCF) model within Amazon SageMaker to detect anomalies in the data.

Answer: A
