1Y0-204 Study Test, 1Y0-204 Exam Simulator Fee

How to improve your IT ability and increase professional IT knowledge of 1Y0-204 real exam in a short time? Obtaining valid training materials will accelerate the way of passing 1Y0-204 actual test in your first attempt. It will just need to take one or two days to practice Citrix 1Y0-204 Test Questions and remember answers. You will free access to our test engine for review after payment.

Citrix 1Y0-204 Certification Exam is intended for IT professionals who have experience working with Citrix Virtual Apps and Desktops 7. Candidates are recommended to have at least six months of hands-on experience with Citrix Virtual Apps and Desktops 7 before taking the exam. In addition, candidates should have a basic understanding of networking, Windows Server administration, and Active Directory.

Citrix Virtual Apps and Desktops 7 Administration Sample Questions (Q209-Q214):

NEW QUESTION # 209

Scenario: A Citrix Administrator has executed the following command:

```
set httpcallout httpcallout1 -cacheForSecs 120
```

What will be the effect of this command?

- A. The cache duration of the HTTP response is set to 120 seconds.
- **B. The cache duration of the HTTP callout response is set to 120 seconds.**
- C. The cache duration of the HTTP request is set to 120 seconds.
- D. The cache duration of the HTTP callout request is set to 120 seconds.

Answer: B

Explanation:

Explanation

According to the Citrix documentation, the cacheForSecs parameter of the set httpcallout command specifies the time, in seconds, for which the response from the HTTP callout server is cached. Therefore, the effect of the command is to set the cache duration of the HTTP callout response to 120 seconds.

NEW QUESTION # 210

Scenario: A Citrix Administrator is in the process of migrating a Citrix Virtual Apps and Desktops on-premises deployment to Citrix Cloud with an on-premises resource location. StoreFront and Citrix ADC machines are located on premises. The administrator notices that application enumeration is NOT occurring for resources managed by the Citrix Cloud Site. What does the administrator need to change in order to get application enumeration working?

- A. Decommission the old Citrix Delivery Controllers and Databases.
- B. Remove the Citrix policies on the old Citrix Delivery Controllers.
- C. Add the Citrix Cloud Connectors as XML servers to the existing StoreFront servers.
- **D. Add the Citrix Cloud Connectors as Secure Ticket Authority (STA) servers on Citrix ADC and StoreFront.**

Answer: D

Explanation:

To get application enumeration working in a Citrix Cloud migration scenario with on-premises StoreFront and Citrix ADC, the administrator needs to add the Citrix Cloud Connectors as Secure Ticket Authority (STA) servers on both Citrix ADC and StoreFront12.

NEW QUESTION # 211

A Citrix Administrator is configuring a Citrix ADC high availability (HA) pair and needs to ensure that one Citrix ADC is UP and primary at all times to ensure the business websites are always available. What does the administrator need to do to ensure that the Citrix ADCs still handle web traffic in the event that both nodes become unavailable or fail a health check?

- **A. Configure HA Fail-safe mode on each Citrix ADC independently.**
- B. Configure HA Fail-safe mode on the Primary Citrix ADC only.
- C. Disable HA Fail-safe mode on the Secondary Citrix ADC.
- D. Disable HA Fail-safe mode on the Primary Citrix ADC only.

Answer: A

Explanation:

Explanation

HA Fail-safe mode is a feature that allows the Citrix ADCs to continue processing traffic even if both nodes become unavailable or fail a health check. This feature can be configured on each Citrix ADC independently, and it is recommended to enable it on both nodes for maximum availability. If HA Fail-safe mode is disabled on one node, that node will not process any traffic if it becomes unavailable or fails a health check, and it will not fail over to the other node. This could result in a loss of service for the business websites. Therefore, the correct answer is B.

NEW QUESTION # 212

Scenario: A Citrix ADC receives packets that are destined for a MAC address owned by the Citrix ADC. The destination IP address of the packets does NOT belong to the Citrix ADC. Layer 3 Mode is enabled by default on the Citrix ADC. What will the Citrix ADC do with the packets in this scenario?

- A. Process the packets.

- B. Bridge the packets.
- **C. Route the packets.**
- D. Drop the packets

Answer: C

Explanation:

According to the Citrix Virtual Apps and Desktops 7 Deployment and Administration course, page 14 of Module 1: Architecture Overview, "Layer 3 mode is the default mode of operation for a Citrix ADC appliance. In this mode, the appliance acts as a router and routes packets based on the destination IP address." Therefore, if the Citrix ADC receives packets that are destined for a MAC address owned by the Citrix ADC, but the destination IP address does not belong to the Citrix ADC, it will route the packets based on the destination IP address.

NEW QUESTION # 213

A user calls the help desk to report that when launching any application from within their published desktop session, it takes a long time and the overall performance is poor.

Which Citrix Director report can a Citrix Administrator use to initiate the investigation of the issue?

- **A. Load Evaluator in Trends**
- B. Launch Failures in Trends
- C. Machine Utilization in Machine Details
- D. Session Data in Filters

Answer: A

Explanation:

Explanation/Reference: <https://www.citrix.com/blogs/2014/09/22/citrix-director-trends-explained/>
