In order to let you know the latest information for the exam, we offer you free update for one year, and our system will send the latest version for EMT Exam Dumps to your email automatically.

## NREMT Emergency Medical Technicians Exam Sample Questions (Q35-Q40):

### NEW QUESTION # 35

You have consulted with on-line medical direction to terminate resuscitation of a 74-year-old female. How should you inform her family of this decision?

- A. "She is at peace."
- B. "She has died."
- C. "She has passed."
- D. "She didn't make it."

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

EMS professionals are expected to use empathetic yet clear language when communicating a death. The phrase "She has passed" is both respectful and commonly accepted as an appropriate way to convey death compassionately without being overly clinical or harsh. "Died" may sound too blunt in an emotional moment, while "didn't make it" and "at peace" can feel vague or dismissive. Clear, empathetic communication is critical for patient dignity and family support during death notifications.

### NEW QUESTION # 36

Through which of the following routes is hepatitis A transmitted?

- A. Fecal
- B. Urine
- C. Blood
- D. Saliva

**Answer: A**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Hepatitis A virus is transmitted exclusively via the fecal-oral route. Ingesting contaminated food or water allows the virus to enter the digestive tract, infecting liver cells. It's often spread through poor hand hygiene or unsanitary food handling. It is not bloodborne, unlike Hepatitis B and C. It is not commonly spread through saliva or urine.

### NEW QUESTION # 37

A mountain climber tells you that he came down from a hike because he was coughing up blood. You should suspect

- A. Spontaneous pneumothorax
- B. Neoplasm
- C. Pulmonary edema
- D. Pulmonary embolism

**Answer: D**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Hemoptysis (coughing up blood) in a physically active person, such as a mountain climber, strongly suggests a pulmonary embolism (PE), particularly due to:

- \* Dehydration
- \* Prolonged exertion or immobility
- \* High altitude increasing clot risk

Symptoms may include:

- \* Shortness of breath
- \* Chest pain
- \* Tachypnea
- \* Hemoptysis

Pulmonary edema generally causes pink frothy sputum and is more associated with heart failure. Neoplasm (lung cancer) is possible but much less acute in onset. Spontaneous pneumothorax causes dyspnea and pleuritic chest pain but not typically hemoptysis.

### NEW QUESTION # 38

A 67-year-old patient is sitting in the tripod position. What general impression should the EMT most strongly suspect from this patient's position?

- A. The patient is having a seizure
- B. The patient has abdominal pain
- **C. The patient has trouble breathing**
- D. The patient is in cardiac arrest

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The tripod position- sitting upright, leaning forward, supporting the upper body with arms on knees - is a classic sign of respiratory distress. This position:

- \* Maximizes diaphragmatic movement
- \* Engages accessory muscles of respiration
- \* Improves air exchange in patients with obstructive airway diseases (e.g., COPD, asthma) It is rarely used by patients with abdominal pain or seizures and is not associated with cardiac arrest (where unconsciousness is expected).

### NEW QUESTION # 39

A 42-year-old male states, "I can't breathe" after being shot in his upper thigh. Bystanders have applied direct pressure to his thigh and the bleeding is controlled. You should first

- A. Assess for other life-threatening injuries
- B. Replace the bystander's dressing with sterile gauze
- **C. Administer oxygen**
- D. Apply a tourniquet

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The patient's complaint of difficulty breathing is an airway/breathing issue and takes precedence over a controlled extremity bleed. The

first action is to administer oxygen and evaluate respiratory effort. Though reassessing the wound is important, oxygenation is the priority when airway compromise or respiratory distress is present. Tourniquets are for uncontrolled bleeding, which is not the case here.
