Latest Digital-Forensics-in-Cybersecurity Exam Pattern & Relevant Digital-Forensics-in-Cybersecurity Answers

There is no denying that no exam is easy because it means a lot of consumption of time and effort. Especially for the upcoming Digital-Forensics-in-Cybersecurity exam, although a large number of people take the exam every year, only a part of them can pass. If you are also worried about the exam at this moment, please take a look at our Digital-Forensics-in-Cybersecurity Study Materials which have become the leader in this career on the market. And if you have a try on our Digital-Forensics-in-Cybersecurity preparation quiz, you will be satisfied.

WGU Digital Forensics in Cybersecurity (D431/C840) Course Exam Sample Questions (Q65-Q70):

NEW QUESTION # 65

Which characteristic applies to solid-state drives (SSDs) compared to magnetic drives?

- A. They are generally slower
- B. They have moving parts
- C. They have a lower cost per gigabyte
- **D. They are less susceptible to damage**

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Solid-state drives (SSDs) use flash memory and have no moving mechanical parts, making them more resistant to physical shock and damage compared to magnetic drives, which rely on spinning platters.

* This resilience makes SSDs favorable in environments with higher physical risk.

* However, data recovery from SSDs can be more complex due to wear-leveling and TRIM features.

Reference: NIST and forensic hardware guides highlight SSD durability advantages over traditional magnetic storage.

NEW QUESTION # 66

Where does Windows store passwords for local user accounts?

- A. HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\NetworkList\Profiles
- B. Security file in Windows\System32
- C. HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\WZC\SVC\Parameters\Interfaces
- **D. SAM file in Windows\System32**

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Windows stores the hashes of local user account passwords in the SAM (Security Account Manager) file, which is located in the Windows\System32\config directory. This file is a critical component in the Windows security infrastructure.

* The registry paths in A and B refer to network profiles and wireless configuration data, unrelated to password storage.

* The "Security" file also resides in the System32\config folder but stores security policy data rather than password hashes.

* The SAM file stores password hashes and is targeted in forensic investigations for credential recovery.

Reference: Microsoft technical documentation and NIST digital forensics standards explain that the SAM file is the definitive source for local user password hashes in Windows systems.

NEW QUESTION # 67

Which Windows 7 operating system log stores events collected from remote computers?

- A. Security
- B. System
- C. Application
- **D. ForwardedEvents**

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

TheForwardedEventslog in Windows 7 is specifically designed to store events collected from remote computers via event forwarding. This log is part of the Windows Event Forwarding feature used in enterprise environments to centralize event monitoring.

- * TheSystemandApplicationlogs store local system and application events.
- * TheSecuritylog stores local security-related events.
- * ForwardedEventscollects and stores events forwarded from other machines.

Microsoft documentation and NIST SP 800-86 mention the use of ForwardedEvents for centralized event log collection in investigations.

NEW QUESTION # 68

Tom saved a message using the least significant bit (LSB) method in a sound file and uploaded this sound to his own website. What is the carrier in this example?

- A. The least significant bit method
- **B. The sound file**
- C. Tom's website
- D. The message

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In steganography, the carrier is the file or medium used to hide the secret message. In this example, the sound file is the carrier because it contains the hidden message embedded using the least significant bit method. The message is the payload, and the website is merely the distribution platform.

- * LSB is the embedding technique, not the carrier.

- * The message is the payload, not the carrier.

- * The website is not involved in data hiding.

NIST and steganography references clearly define the carrier as the container holding the hidden data.

NEW QUESTION # 69

Which file system is supported by Mac?

- A. FAT32
- **B. Hierarchical File System Plus (HFS+)**
- C. EXT4
- D. NTFS

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Mac systems traditionally use the Hierarchical File System Plus (HFS+), which supports features such as journaling and metadata handling suited for Mac OS environments. Newer versions use APFS but HFS+ remains relevant.

- * NTFS is primarily a Windows file system.

- * EXT4 is a Linux file system.

- * FAT32 is a generic cross-platform file system but lacks advanced features.

Reference:Apple and NIST documentation confirm HFS+ as a Mac-supported file system for forensic analysis.

NEW QUESTION # 70
