Amazon AWS Certified DevOps Engineer - Professional Sample Questions (Q57-Q62):

NEW QUESTION # 57

There is a very serious outage at AWS. EC2 is not affected, but your EC2 instance deployment scripts stopped working in the region with the outage. What might be the issue?

- A. S3 is unavailable, so you can't create EBS volumes from a snapshot you use to deploy new volumes.
- B. None of the other answers make sense. If EC2 is not affected, it must be some other issue.
- C. AWS turns off the DeployCode API call when there are major outages, to protect from system floods.
- D. The AWS Console is down, so your CLI commands do not work.

Answer: A

Explanation:

Explanation

The CBS Snapshots are stored in S3, so if you have an scripts which deploy CC2 Instances, the CBS volumes need to be constructed from snapshots stored in S3.

You can back up the data on your Amazon CBS volumes to Amazon S3 by taking point-in-time snapshots.

Snapshots are incremental backups, which means that only

the blocks on the device that have changed after your most recent snapshot are saved. This minimizes the time required to create the snapshot and saves on storage costs by not duplicating data. When you delete a snapshot, only the data unique to that snapshot is removed. Each snapshot contains all of the information needed to restore your data (from the moment when the snapshot was taken) to a new CBS volume.

NEW QUESTION # 58

Which of the following is incorrect when it comes to using the instances in an Opswork stack?

- A. In a stack you can use a mix of both Windows and Linux operating systems
- B. You can start and stop instances manually in a stack
- C. You can use custom AMI'S as long as they are based on one of the AWS OpsWorks Stacks-supported AMIs
- D. You can use time-based automatic scaling with any stack

Answer: A

Explanation:

Explanation

The AWS documentation mentions the following about Opswork stack

* A stack's instances can run either Linux or Windows.

A stack can have different Linux versions or distributions on different instances, but you cannot mix Linux and Windows instances.

* You can use custom AMIs (Amazon Machine Images), but they must be based on one of the AWS Ops Works Stacks-supported AMIs

* You can start and stop instances manually or have AWS OpsWorks Stacks automatically scale the number of instances. You can use time-based automatic scaling with any stack; Linux stacks also can use load-based scaling.

* In addition to using AWS OpsWorks Stacks to create Amazon EC2 instances, you can also register instances with a Linux stack that were created outside of AWS OpsWorks Stacks.

NEW QUESTION # 59

What is the maximum time messages can be stored in SQS?

- A. 4 days
- B. one month
- C. 7 days
- D. 14 days

Answer: D

Explanation:

A message can be stored in the Simple Queue Service (SQS) from 1 minute up to a maximum of 14 days.

NEW QUESTION # 60

You are using Elastic Beanstalk to manage your e-commerce store. The store is based on an open source e-commerce platform

and is deployed across multiple instances in an Auto Scaling group. Your development team often creates new "extensions" for the e-commerce store.

These extensions include PHP source code as well as an SQL upgrade script used to make any necessary updates to the database schema.

You have noticed that some extension deployments fail due to an error when running the SQL upgrade script. After further investigation, you realize that this is because the SQL script is being executed on all of your Amazon EC2 instances.

How would you ensure that the SQL script is only executed once per deployment regardless of how many Amazon EC2 instances are running at the time?

- A. Use a "Solo Command" within an Elastic Beanstalk configuration file to execute the script.
The Elastic Beanstalk service will ensure that the command is only executed once.
- B. Update the Amazon RDS security group to only allow write access from a single instance in the Auto Scaling group; that way, only one instance will successfully execute the script on the database.
- C. Make use of the Amazon EC2 metadata service to query whether the instance is marked as the leader" in the Auto Scaling group.
Only execute the script if "true" is returned.
- D. Use a "Container command" within an Elastic Beanstalk configuration file to execute the script, ensuring that the "leader only" flag is set to true.

Answer: D

NEW QUESTION # 61

You are administering a continuous integration application that polls version control for changes and then launches new Amazon EC2 instances for a full suite of build tests.

What should you do to ensure the lowest overall cost while being able to run as many tests in parallel as possible?

- A. Perform all tests on the continuous integration system, using AWS OpsWorks for unit, integration, and build tests.
- B. Perform syntax and build tests on the continuous integration system before launching the new Amazon EC2 instance unit and integration tests.
- C. Perform syntax checking on the continuous integration system before launching a new AWS Data Pipeline for coordinating the output of unit, integration, and build tests.
- D. Perform syntax checking on the continuous integration system before launching a new Amazon EC2 instance for build test, unit and integration tests.

Answer: B
