Amazon AWS Certified DevOps Engineer - Professional Sample Questions (Q531-Q536):

NEW QUESTION # 531

An online retail company based in the United States plans to expand its operations to Europe and Asia in the next six months. Its product currently runs on Amazon EC2 instances behind an Application Load Balancer. The instances run in an Amazon EC2 Auto Scaling group across multiple Availability Zones. All data is stored in an Amazon Aurora database instance.

When the product is deployed in multiple regions, the company wants a single product catalog across all regions, but for compliance purposes, its customer information and purchases must be kept in each region.

How should the company meet these requirements with the LEAST amount of application changes?

- A. Use Amazon Redshift for the product catalog and Amazon DynamoDB tables for the customer information and purchases.
- B. Use Amazon DynamoDB global tables for the product catalog and regional tables for the customer information and purchases
- C. Use Aurora for the product catalog and Amazon DynamoDB global tables for the customer information and purchases.
- **D. Use Aurora with read replicas for the product catalog and additional local Aurora instances in each region for the customer information and purchases.**

Answer: D

NEW QUESTION # 532

Which of the following Cloudformation helper scripts can help install packages on EC2 resources

- A. cfn-signal
- B. cfn-get-metadata
- C. cfn-hup
- **D. cfn-init**

Answer: D

Explanation:

Explanation

The AWS Documentation mentions

Currently, AWS CloudFormation provides the following helpers:

cfn-init: Used to retrieve and interpret the resource metadata, installing packages, creating files and starting services.

cfn-signal: A simple wrapper to signal an AWS CloudFormation CreationPolicy or WaitCondition, enabling you to synchronize other resources in the stack with the application being ready.

cfn-get-metadata: A wrapper script making it easy to retrieve either all metadata defined for a resource or path to a specific key or subtree of the resource metadata.

cf

n-hup: A daemon to check for updates to metadata and execute custom hooks when the changes are detected.

For more information on helper scripts, please visit the below URL: [http://docs.aws.a](http://docs.aws.amazon.com/AWSCloudFormation/latest/UserGuide/cfn-helper-scripts-reference.html)

[mazon.com/AWSCloudFormation/latest/UserGuide/cfn-helper-scripts-reference.html](http://docs.aws.amazon.com/AWSCloudFormation/latest/UserGuide/cfn-helper-scripts-reference.html)

NEW QUESTION # 533

A Developer is designing a continuous deployment workflow for a new Development team to facilitate the process for source code promotion in AWS. Developers would like to store and promote code for deployment from development to production while maintaining the ability to roll back that deployment if it fails.

Which design will incur the LEAST amount of downtime?

- A. Create one repository for each Developer in AWS CodeCommit and another repository to hold the production code. Use AWS CodeBuild to merge development and production repositories, and deploy to production by using AWS CodeDeploy for a blue/green deployment.
- B. Create a shared Amazon S3 bucket for the Development team to store their code. Set up an Amazon CloudWatch Events rule to trigger an AWS Lambda function that deploys the code to production by using AWS CodeDeploy for a blue/green deployment.
- C. Create one repository in AWS CodeCommit. Create a development branch to hold merged changes. Use AWS CodeBuild to build and test the code stored in the development branch triggered on a new commit. Merge to the master and deploy to production by using AWS CodeDeploy for a blue/green deployment.
- D. Create one repository for development code in AWS CodeCommit and another repository to hold the production code. Use AWS CodeBuild to merge development and production repositories, and deploy to production by using AWS CodeDeploy for a blue/green deployment.

Answer: C

NEW QUESTION # 534

A company hosts parts of a Python-based application using AWS Elastic Beanstalk. An Elastic Beanstalk CLI is being used to create and update the environments. The Operations team detected an increase in requests in one of the Elastic Beanstalk environments that caused downtime overnight. The team noted that the policy used for AWS Auto Scaling is NetworkOut. Based on load testing metrics, the team determined that the application needs to scale CPU utilization to improve the resilience of the environments. The team wants to implement this across all environments automatically.

Following AWS recommendations, how should this automation be implemented?

- A. Using ebextensions, configure the option setting MeasureName to CPUUtilization within the aws:autoscaling:trigger namespace.
- B. Using ebextensions, place a script within the files key and place it in /opt/elasticbeanstalk/hooks/appdeploy/pre to perform an API call to modify the scaling metric to CPUUtilization for the Auto Scaling configuration. Use leader_only to place this script in only the first instance launched within the environment.
- C. Using ebextensions, create a custom resource that modifies the AWSEBAutoScalingScaleUpPolicy and AWSEBAutoScalingScaleDownPolicy resources to use CPUUtilization as a metric to scale for the Auto Scaling group.
- D. Using ebextensions, place a command within the container_commands key to perform an API call to modify the scaling metric to CPUUtilization for the Auto Scaling configuration. Use leader_only to execute this command in only the first instance launched within the environment.

Answer: A

NEW QUESTION # 535

As part of your continuous deployment process, your application undergoes an I/O load performance test before it is deployed to production using new AMIs.

The application uses one Amazon Elastic Block Store (EBS) PIOPS volume per instance and requires consistent I/O performance. Which of the following must be carried out to ensure that I/O load performance tests yield the correct results in a repeatable manner?

- A. Ensure that the Amazon EBS volume has been pre-warmed by creating a snapshot of the volume before the test.
- B. Ensure that the Amazon EBS volumes have been pre-warmed by reading all the blocks before the test.
- C. Ensure that the I/O block sizes for the test are randomly selected.
- D. Ensure that snapshots of the Amazon EBS volumes are created as a backup.
- E. Ensure that the Amazon EBS volume is encrypted.

Answer: B

NEW QUESTION # 536

.....

As you see, all of the three versions are helpful for you to get the DOP-C01 certification: the PDF, Software and APP online. So there is another choice for you to purchase the comprehensive version which contains all the three formats, it is the Value Pack. Besides, the price for the Value Pack is quite favorable.
