## Microsoft Implementing Analytics Solutions Using Microsoft Fabric Sample Questions (Q85-Q90):

### NEW QUESTION # 85

Note: This section contains one or more sets of questions with the same scenario and problem. Each question presents a unique solution to the problem. You must determine whether the solution meets the stated goals. More than one solution in the set might solve the problem. It is also possible that none of the solutions in the set solve the problem.

After you answer a question in this section, you will NOT be able to return. As a result, these questions do not appear on the Review Screen.

Your network contains an on-premises Active Directory Domain Services (AD DS) domain named contoso.com that syncs with a Microsoft Entra tenant by using Microsoft Entra Connect.

You have a Fabric tenant that contains a semantic model.

You enable dynamic row-level security (RLS) for the model and deploy the model to the Fabric service. You query a measure that includes the username () function, and the query returns a blank result. You need to ensure that the measure returns the user principal name (UPN) of a user. Solution: You update the measure to use the USEROBJECT () function. Does this meet the goal?

- A. Yes
- B. No

Answer: B

#### NEW QUESTION # 86

You have a Fabric warehouse named Warehouse1 that contains a table named dbo.Product. dbo.Product contains the following columns.

Name	Description
Item	Name of the product
UnitPrice	Price per unit in U.S. dollars for each product

You need to use a T-SQL query to add a column named PriceRange to dbo.Product. The column must categorize each product based on UnitPrice. The solution must meet the following requirements:

- \* If UnitPrice is 0, PriceRange is "Not for resale".
- \* If UnitPrice is less than 50, PriceRange is "Under \$50".
- \* If UnitPrice is between 50 and 250, PriceRange is "Under \$250".
- \* In all other instances, PriceRange is "\$250+".

How should you complete the query? To answer, drag the appropriate values to the correct targets. Each value may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

#### NEW QUESTION # 87

You have a Fabric tenant that contains a workspace named Workspace1.

You plan to deploy a semantic model named Model1 by using the XMLA endpoint.

You need to optimize the deployment of Model1. The solution must minimize how long it takes to deploy Model1.

What should you do in Workspace1?

- A. Select Users can edit data models in the Power BI service.
- B. Select Small semantic model storage format.
- C. Set Enable Cache for Shortcuts to On.
- D. Select Large semantic model storage format.

**Answer: D**

Explanation:

If you're planning to use XMLA endpoint-based tools for semantic model write operations, be sure to enable the setting, even for semantic models that you wouldn't necessarily characterize as a large semantic model. When enabled, the large semantic model storage format can improve XMLA write operations performance.

## NEW QUESTION # 89

You have a Fabric workspace that contains a warehouse named Warehouse!. Warehouse! contains the following data.

Table name	Column name	Data type
Employee	EmployeeID	Int
Employee	EmployeeName	Varchar(128)
Employee	EmployeePosition	Varchar(64)
Contract	EmployeeID	Int
Contract	ContractType	Varchar(64)
Contract	StartDate	Datetime2
Contract	EndDate	Datetime2

You need to create a T-SQL statement that will denormalize the tables and include the ContractType and StartDate attributes in the results. The solution must meet the following requirements:

- \* Include attributes from matching rows in the Contract table.
- \* Ensure that all the rows from the Employee table are preserved.
- \* Return the total number of employees per contract type for all the contract types that have more than two employees.

How should you complete the statement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

## Answer Area

```

WITH result AS(
SELECT
    e.EmployeeID
    , e.EmployeeName
    , e.EmployeePosition
    , c.ContractType
FROM Employee AS e
LEFT OUTER JOIN Contract AS c on c.EmployeeID = e.EmployeeID
) AS TotalEmployees, ContractType
FROM result
GROUP BY ContractType
HAVING COUNT(DISTINCT EmployeeID) > 2
