

Dumps 1z1-076 Guide, Certification 1z1-076 Exam Cost

BTW, DOWNLOAD part of TestPassKing 1z1-076 dumps from Cloud Storage: <https://drive.google.com/open?id=1ilw1WdK4CUx-X8veGgbbDty6vRtx4hcC>

For candidates who are going to attend the exam, passing the exam is a good wish. 1z1-076 exam torrent will help you to pass the exam just one time, and we are pass guaranteed and money back guaranteed if you fail the exam. We promise to refund all of your money if you fail the exam by using the 1z1-076 Exam Torrent, or if you have other exam to attend, we can also replace other 2 valid exam dumps for you, at the same time you can get the update version for 1z1-076 exam torrent. In addition, you can consult us if you have any questions.

Do you want to gain all these Oracle Database 19c: Data Guard Administration (1z1-076) certification exam benefits? Looking for the quick and complete 1z1-076 exam dumps preparation way that enables you to pass the 1z1-076 certification exam with good scores? If your answer is yes then you are at the right place and you do not need to go anywhere. Just download the TestPassKing 1z1-076 Questions and start 1z1-076 exam preparation without wasting further time.

Certification 1z1-076 Exam Cost, Test 1z1-076 Guide

TestPassKing provides with actual Oracle 1z1-076 exam dumps in PDF format. You can easily download and use 1z1-076 PDF dumps on laptops, tablets, and smartphones. Our real 1z1-076 dumps PDF is useful for applicants who don't have enough time to prepare for the examination. If you are a busy individual, you can use 1z1-076 Pdf Dumps on the go and save time.

Oracle Database 19c: Data Guard Administration Sample Questions (Q87-Q92):

NEW QUESTION # 87

Examine the following parameter settings of the physical standby database:

* STANDBY_FILE_MANAGEMENT= AUTO

* ENABLED_PDBS_ON_STANDBY=<null>

During which TWO tasks are files automatically created in the physical standby database after structure changes on the primary database?

- A. Adding a data file or creating a tablespace
- B. Performing transportable tablespaces
- C. Renaming a data file in the primary database
- D. Adding or dropping a redo file group
- E. Creating a PDB from the existing PDB within the same CDB

Answer: A,E

Explanation:

When STANDBY_FILE_MANAGEMENT is set to AUTO, the Oracle Data Guard automatically creates, deletes, and renames files on the standby database to match the changes made on the primary database. The tasks that lead to the automatic creation of files on the standby include:

- * Adding a data file or creating a tablespace (C): When a new tablespace is created or a new data file is added on the primary database, the standby database automatically replicates this action, maintaining structural consistency with the primary database.
 - * Creating a PDB from the existing PDB within the same CDB (D): Creating a new Pluggable Database (PDB) within a Multitenant Container Database (CDB) on the primary database triggers an automatic creation of the corresponding PDB within the standby CDB.

- * Oracle Data Guard Concepts and Administration Guide

NEW QUESTION # 88

Which three actions are performed by the START PLAN procedure of the DBMS ROLLING package?

- A. creating a guaranteed restore point on the standby databases
- B. creating a guaranteed restore point on the primary database
- C. switching the primary database to the logical standby role
- D. building a LogMiner dictionary on the primary database instance
- E. converting the designated physical standby database into a logical standby database
- F. starting media recovery on all the Leading Group Standby databases

Answer: A,B,D

Explanation:

The DBMS_ROLLING package facilitates a rolling upgrade process across a Data Guard configuration. The START PLAN procedure in particular handles several critical actions, including:

Creating a guaranteed restore point on the standby databases (B): This ensures that the standby databases can be reverted to their state before the rolling upgrade process in case of any issues.

Building a LogMiner dictionary on the primary database instance (C): This is necessary for logical standby databases to interpret redo data during the SQL Apply process.

Creating a guaranteed restore point on the primary database (D): Similar to the standby databases, this ensures that the primary database can be reverted to a known good state if necessary.

NEW QUESTION # 89

Your Data Guard environment has a remote physical standby database with real-time query enabled, which is used for reporting, and a logical standby database used for DSS reporting.

Switchovers or failovers are possible due to testing or in case of a disaster.

Clients use local TNSNAMES.ORA files to define connection strings to the database instances.

Which three will prevent clients from connecting to the wrong database instances?

- A. The client applications must use the correct TNS entries when requesting connections to the database instances.
- B. Client TNS entries for the databases use the correct service names for the intended service.
- C. The DB_NAME and DB_UNIQUE_NAME parameters must be set to the same value for all the databases in the Data Guard environment.
- D. A service name is registered with the local listener of each database instance.
- E. The LOCAL_LISTENER parameter on the primary database instance must always be set.
- F. The standby database services must be defined statically with the Listeners running on the standby database hosts.
- G. Oracle Net connectivity to the primary database instance must be established on all the standby database instances.

Answer: A,B,F

Explanation:

Based on Oracle Database 19c: Data Guard Administration documents, the three measures that can prevent clients from connecting to the wrong database instances during switchovers, failovers, or regular operations in a Data Guard environment are:

- B . The standby database services must be defined statically with the Listeners running on the standby database hosts.
- D . The client applications must use the correct TNS entries when requesting connections to the database instances.
- E . Client TNS entries for the databases use the correct service names for the intended service.

In an Oracle Data Guard configuration, correctly configuring Oracle Net Services (including TNS entries and listeners) is crucial for ensuring that clients connect to the appropriate database instance, whether it's the primary or standby. Defining services on the standby database and associating them with listeners ensures that client applications can connect to the standby when needed, especially useful in a role transition or when the standby is open for read-only access or real-time query. It's essential that TNS entries used by client applications specify the correct service names that correspond to the intended database roles, such as primary or standby. This setup facilitates seamless connectivity to the appropriate instance based on the role, especially critical during switchovers and failovers when the roles of the databases change.

Reference:

Oracle's Data Guard concepts and administration guide provides extensive information on configuring network services for Data Guard environments, ensuring that applications connect to the correct database instance based on the current role of the databases in the Data Guard configuration.

NEW QUESTION # 90

You created the PRODSBY1 physical standby database for the PROD primary database using gsql and RMAN. You are planning to create a Data Guard Broker configuration. You execute the command:

```
DGMGRL> CREATE CONFIGURATION 'DGConfig' AS
> PRIMARY DATABASE IS 'PROD'
> CONNECT IDENTIFIER IS PROD;
```

Which three statements are true regarding the execution of the command?

- A. The command will execute successfully only if Oracle Net connectivity to the PROD and PRODSBY1 database instances are defined on the primary host.
- B. The PRODSBY1 standby database is automatically added to the configuration if DG_BROKER_START is TRUE for PRODSBY1.
- C. The Data Guard Broker configuration files are automatically created in the destinations specified by the DG_BROKER_CONFIG_FILEn initialization parameters on the primary database.
- D. The command will execute successfully only if the DG_BROKER_START initialization parameter is set to TRUE for the PROD database instance.
- E. The command will execute successfully only if Oracle Net connectivity to the PROD database instance is defined on the primary host.
- F. The PRODSBY1 standby database is automatically added to the configuration if Oracle Net connectivity to the PRODSBY1 database instance is defined on the primary host.

Answer: C,D,E

Explanation:

The command executed (CREATE CONFIGURATION 'DGConfig' AS PRIMARY DATABASE IS 'PROD' CONNECT IDENTIFIER IS PROD;) is used to create a Data Guard Broker configuration named 'DGConfig'. The successful execution of this command depends on several conditions:

A: The DG_BROKER_START parameter must be set to TRUE on the primary database to start the Data Guard Broker processes. Without the broker processes running, the configuration cannot be created.

D: Oracle Net connectivity to the PROD database instance must be established on the primary host. This is because the Data Guard Broker requires network accessibility to communicate with the primary database and manage the configuration.

E: When the configuration is created, the Data Guard Broker configuration files are indeed automatically created in the locations specified by the DG_BROKER_CONFIG_FILEn parameters on the primary database.

It's important to note that the command will not automatically add the PRODSBY1 standby database to the configuration (thus B and C are not correct), and there is no requirement for the standby database to have Oracle Net connectivity defined on the primary host for the execution of this command (making F incorrect as well).

NEW QUESTION # 91

There are currently 6 apply and 6 pfile processes running and no idle apply processes on your logical standby database.

The max_SERVERS SQL apply parameter and number of archiver processes are both set to 12.

Identify two changes, each of which would allow you to increase the number of apply processes.

- A. Increase the value for the MAX_SERVERS SQL apply parameter.

- B. Decrease the number of archiver processes on the standby database.
- C. Increase the RECOVERY_PARALLEL initialization parameter.
- D. Increase the processes initialization parameter. D Decrease the number of FREPARER processes.
- E. Increase the parallel_max_server initialization parameter.

Answer: A,E

Explanation:

To increase the number of applier processes on a logical standby database, the following changes can be made:

* C: Increasing the value for the MAX_SERVERS SQL apply parameter would allow for more applier processes to be initiated, assuming that system resources permit.

* D: Increasing the PARALLEL_MAX_SERVERS initialization parameter would allow for more parallel execution processes, which can be used by SQL apply to increase the number of applier processes.

Option A is incorrect as decreasing the number of archiver processes will not necessarily increase the number of applier processes; these are unrelated components.

Option B is incorrect because the 'FREPARER' processes do not exist, it seems to be a typographical error, and the 'REPARER' is not a valid Oracle process or parameter.

Option E is incorrect because the RECOVERY_PARALLELISM parameter controls the number of processes used for instance recovery and media recovery, not for SQL apply.

References: Oracle Data Guard Concepts and Administration guide details the configuration and tuning of SQL apply-related parameters in logical standby databases.

NEW QUESTION # 92

.....

Buying any product should choose a trustworthy company. Our TestPassKing can give you the promise of the highest pass rate of 1z1-076 exam; we can give you a promise to try our 1z1-076 software for free, and the promise of free updates within a year after purchase. To resolve your doubts, we assure you that if you regrettably fail the 1z1-076 Exam, we will full refund all the cost you buy our study materials. TestPassKing is your best partners in your preparation for 1z1-076 exam.
