NEW QUESTION # 90

On the network shown in the figure, the DHCP server function is enabled on GE0/0/0 of R2, and the address pool is an interface address pool.

When GE0/0/0 and GE0/0/1 of R1 function as DHCP clients, only one interface can obtain an IP address by default.

Options:

- A. TRUE
- B. FALSE

Answer: A

Explanation:

Comprehensive and Detailed In-Depth Explanation:

Understanding the DHCP Process in This Scenario:

* DHCP Server on R2:

* The DHCP server is configured on interface GE0/0/0 of R2.

* The address pool is an interface address pool, meaning that IP addresses are allocated from the subnet of GE0/0/0 (i.e., 10.0.12.0/24).

* DHCP Clients on R1:

* Both interfaces (GE0/0/0 and GE0/0/1) on R1 are set as DHCP clients, meaning they will send DHCP DISCOVER messages to obtain an IP address dynamically.

* Why Only One Interface Gets an IP Address?

* Interface address pools in Huawei devices assign only one IP address per MAC address (which is typically the router's MAC).

* Since both interfaces belong to R1, they share the same MAC address when making a DHCP request.

* As a result, the DHCP server on R2 only assigns one IP address to the first requesting interface.

* The second request is ignored or denied by the DHCP server due to the duplicate MAC address issue.

Key Takeaways:

- * Huawei routers using an interface-based DHCP address pool assign only one IP per MAC address.
- * Since both interfaces on R1 have the same MAC, only one gets an IP.
- * This behavior is expected in Huawei's HCIP-Datacom-certified DHCP configurations.
