IBM MQ v9.4 Administrator - Professional Sample Questions (Q21-Q26):

NEW QUESTION # 21

Which IBM MQ component acts as an intermediary that ensures messages are routed correctly between sending and receiving applications and can be configured to handle different message formats, security policies, and transactional behavior?

- **A. Message Channel Agent (MCA)**
- B. Channel Initiator

- C. Queue Manager
- D. Application Programming Interface (API)

Answer: A

Explanation:

The Message Channel Agent (MCA) is responsible for moving messages between queue managers through channels, handling transformation, security, and transactional integrity.

NEW QUESTION # 22

In IBM MQ architecture, when an application sends a persistent message that must survive system restarts and power failures, which internal mechanism ensures that the message is not lost until it is delivered successfully?

- A. Message is logged to recovery logs and queue files for durability
- B. Message is stored in the Dead Letter Queue by default until the system restarts
- C. Message is written only to memory cache and flushed when resources are freed
- D. Message is duplicated in multiple queues across different queue managers

Answer: A

Explanation:

Persistent messages are written to queue files and recovery logs before being acknowledged, ensuring durability and recovery after failures.

NEW QUESTION # 23

In IBM MQ, which feature ensures that messages are not lost in transit even if the receiving application or the queue manager crashes, providing guaranteed delivery and exactly-once delivery semantics?

- A. Distributed messages without confirmation
- B. Non-persistent messages
- C. Persistent messages stored on disk
- D. Temporary messages stored in memory

Answer: C

Explanation:

IBM MQ provides persistent messaging to ensure messages survive system crashes, guaranteeing delivery and exactly-once semantics.

NEW QUESTION # 24

In scenarios where multiple applications need to process messages from the same queue simultaneously, which IBM MQ feature ensures that messages are distributed among consumers without duplication, and how does it maintain data integrity?

- A. Queue Grouping distributes messages among multiple consumers so that each message is consumed by only one application, maintaining message integrity.
- B. Clustering replicates messages to all queue managers, which ensures each consumer processes every message.
- C. Shared queues allow all consumers to read every message, which may lead to duplication.
- D. Transactional queues automatically discard messages after the first consumer reads them.

Answer: A

NEW QUESTION # 25

When administrators configure queue sharing groups in IBM MQ on z/OS, what unique benefit do these groups provide in terms of workload and message availability compared to stand-alone queue managers?

- A. They eliminate the need for security and access control mechanisms
- B. They replicate queues only in memory for faster performance

- C. They restrict queue access to one system at a time for safety
- **D. They allow queues to be accessed simultaneously by multiple queue managers in the group**

Answer: D

Explanation:

Queue sharing groups enable multiple queue managers to share queues in a coupling facility, ensuring higher availability and workload distribution across systems.
