

Use Microsoft GH-500 Exam Questions [2026]-Forget About Failure

P.S. Free & New GH-500 dumps are available on Google Drive shared by Pass4suresVCE: <https://drive.google.com/open?id=1VVg9BtUDbGYDc1cVTp72BzYPnvdLGSRb>

Our website is a leading dumps provider worldwide that offers the latest valid test questions and answers for certification test, especially for Microsoft practice test. We paid great attention to the study of GH-500 vce braindumps for many years and are specialized in the questions of actual test. You can find everything that you need to pass test in our GH-500 learning materials.

Microsoft GH-500 exam dumps certification will not only improve the quality of your resume, but it can open the door to new opportunities for employment. It is compulsory to prepare with reliable and valid GH-500 dumps that ensures 100% success on the very first attempt. There is nothing more valuable than being awarded the GitHub Advanced Security Certification Exam that can allow you to earn an impressive position in the industry of Microsoft. We hope you will be able to enjoy a positive experience making preparations with our latest and valid GH-500 Exam Questions And Answers.

GH-500 Real Questions, GH-500 Practice Test Online

We offer you GH-500 study guide with questions and answers, and you can practice it by concealing the answers, and when you have finished practicing, you can cancel the concealment, through the way like this, you can know the deficient knowledge for GH-500 exam dumps, so that you can put your attention to the disadvantages. In addition, we also have the free demo for GH-500 Study Guide for you to have a try in our website. These free demos will give you a reference of showing the mode of the complete version. If you want GH-500 exam dumps, just add them into your card.

Microsoft GH-500 Exam Syllabus Topics:

Topic	Details

Topic 1	<ul style="list-style-type: none"> Configure and use Code Scanning with CodeQL: This domain measures skills of Application Security Analysts and DevSecOps Engineers in code scanning using both CodeQL and third-party tools. It covers enabling code scanning, the role of code scanning in the development lifecycle, differences between enabling CodeQL versus third-party analysis, implementing CodeQL in GitHub Actions workflows versus other CI tools, uploading SARIF results, configuring workflow frequency and triggering events, editing workflow templates for active repositories, viewing CodeQL scan results, troubleshooting workflow failures and customizing configurations, analyzing data flows through code, interpreting code scanning alerts with linked documentation, deciding when to dismiss alerts, understanding CodeQL limitations related to compilation and language support, and defining SARIF categories.
Topic 2	<ul style="list-style-type: none"> Configure and use Dependabot and Dependency Review: Focused on Software Engineers and Vulnerability Management Specialists, this section describes tools for managing vulnerabilities in dependencies. Candidates learn about the dependency graph and how it is generated, the concept and format of the Software Bill of Materials (SBOM), definitions of dependency vulnerabilities, Dependabot alerts and security updates, and Dependency Review functionality. It covers how alerts are generated based on the dependency graph and GitHub Advisory Database, differences between Dependabot and Dependency Review, enabling and configuring these tools in private repositories and organizations, default alert settings, required permissions, creating Dependabot configuration files and rules to auto-dismiss alerts, setting up Dependency Review workflows including license checks and severity thresholds, configuring notifications, identifying vulnerabilities from alerts and pull requests, enabling security updates, and taking remediation actions including testing and merging pull requests.
Topic 3	<ul style="list-style-type: none"> Describe the GHAS security features and functionality: This section of the exam measures skills of Security Engineers and Software Developers and covers understanding the role of GitHub Advanced Security (GHAS) features within the overall security ecosystem. Candidates learn to differentiate security features available automatically for open source projects versus those unlocked when GHAS is paired with GitHub Enterprise Cloud (GHEC) or GitHub Enterprise Server (GHEs). The domain includes knowledge of Security Overview dashboards, the distinctions between secret scanning and code scanning, and how secret scanning, code scanning, and Dependabot work together to secure the software development lifecycle. It also covers scenarios contrasting isolated security reviews with integrated security throughout the development lifecycle, how vulnerable dependencies are detected using manifests and vulnerability databases, appropriate responses to alerts, the risks of ignoring alerts, developer responsibilities for alerts, access management for viewing alerts, and the placement of Dependabot alerts in the development process.
Topic 4	<ul style="list-style-type: none"> Describe GitHub Advanced Security best practices, results, and how to take corrective measures: This section evaluates skills of Security Managers and Development Team Leads in effectively handling GHAS results and applying best practices. It includes using Common Vulnerabilities and Exposures (CVE) and Common Weakness Enumeration (CWE) identifiers to describe alerts and suggest remediation, decision-making processes for closing or dismissing alerts including documentation and data-based decisions, understanding default CodeQL query suites, how CodeQL analyzes compiled versus interpreted languages, the roles and responsibilities of development and security teams in workflows, adjusting severity thresholds for code scanning pull request status checks, prioritizing secret scanning remediation with filters, enforcing CodeQL and Dependency Review workflows via repository rulesets, and configuring code scanning, secret scanning, and dependency analysis to detect and remediate vulnerabilities earlier in the development lifecycle, such as during pull requests or by enabling push protection.
Topic 5	<ul style="list-style-type: none"> Configure and use secret scanning: This domain targets DevOps Engineers and Security Analysts with the skills to configure and manage secret scanning. It includes understanding what secret scanning is and its push protection capability to prevent secret leaks. Candidates differentiate secret scanning availability in public versus private repositories, enable scanning in private repos, and learn how to respond appropriately to alerts. The domain covers alert generation criteria for secrets, user role-based alert visibility and notification, customizing default scanning behavior, assigning alert recipients beyond admins, excluding files from scans, and enabling custom secret scanning within repositories.

Microsoft GitHub Advanced Security Sample Questions (Q29-Q34):

NEW QUESTION # 29

When using the advanced CodeQL code scanning setup, what is the name of the workflow file?

- A. codeql-config.yml
- B. codeql-workflow.yml
- **C. codeql-analysis.yml**
- D. codeql-scan.yml

Answer: C

Explanation:

Comprehensive and Detailed Explanation:

In the advanced setup for CodeQL code scanning, GitHub generates a workflow file named codeql-analysis.yml. This file is located in the .github/workflows directory of your repository. It defines the configuration for the CodeQL analysis, including the languages to analyze, the events that trigger the analysis, and the steps to perform during the workflow.

NEW QUESTION # 30

Which CodeQL query suite provides queries of lower severity than the default query suite?

- **A. security-extended**
- B. github/codeql-go/ql/src@main
- C. github/codeql/cpp/ql/src@main

Answer: A

Explanation:

The security-extended query suite includes additional CodeQL queries that detect lower severity issues than those in the default security-and-quality suite.

It's often used when projects want broader visibility into code hygiene and potential weak spots beyond critical vulnerabilities. The other options listed are paths to language packs, not query suites themselves.

NEW QUESTION # 31

Which of the following workflow events would trigger a dependency review? (Each answer presents a complete solution. Choose two.)

- A. commit
- **B. workflow_dispatch**
- **C. pull_request**
- D. trigger

Answer: B,C

Explanation:

Comprehensive and Detailed Explanation:

Dependency review is triggered by specific events in GitHub workflows:

pull_request: When a pull request is opened, synchronized, or reopened, GitHub can analyze the changes in dependencies and provide a dependency review.

workflow_dispatch: This manual trigger allows users to initiate workflows, including those that perform dependency reviews. The trigger and commit options are not recognized GitHub Actions events and would not initiate a dependency review.

NEW QUESTION # 32

Where in the repository can you give additional users access to secret scanning alerts?

- A. Security
- B. Secrets
- C. Insights
- **D. Settings**

Answer: D

Explanation:

To grant specific users access to view and manage secret scanning alerts, you do this via the Settings tab of the repository. From there, under the "Code security and analysis" section, you can add individuals or teams with roles such as security manager. The Security tab only displays alerts; access control is handled in Settings.

NEW QUESTION # 33

What is the purpose of the SECURITY.md file in a GitHub repository?

- A. `readme.md`
- B. `support.md`
- C. `security.md`
- D. `contributing.md`

Answer: C

Explanation:

The correct place to look is the SECURITY.md file. This file provides contributors and security researchers with instructions on how to responsibly report vulnerabilities. It may include contact methods, preferred communication channels (e.g., security team email), and disclosure guidelines.

This file is considered a GitHub best practice and, when present, activates a "Report a vulnerability" button in the repository's Security tab.

NEW QUESTION # 34

Our Microsoft GH-500 practice exam simulator mirrors the Microsoft GH-500 exam experience, so you know what to anticipate on GitHub Advanced Security day. Our Microsoft GH-500 practice test software features various question styles and levels, so you can customize your Microsoft GH-500 Exam Questions preparation to meet your needs.
