

# Python Institute PCEP-30-02 Exam Collection Pdf & New PCEP-30-02 Test Questions

## Updated Python Institute PCEP-30-02 Dumps - Your Path To Success In Exam

Do you fear taking the Certified Entry-Level Python Programmer PCEP-30-02 certification exam? Do you want a reliable and efficient way to prepare for the PCEP - Certified Entry-Level Python Programmer PCEP-30-02 exam? Look no further than BrainDumpsStore. We specialize in providing top-notch study material designed to help you easily pass the Certified Entry-Level Python Programmer PCEP-30-02 certification exam. Our Python Institute **PCEP-30-02 Dumps** will remove your anxiety and help you pass the test with ease. Let's explore how our PCEP-30-02 exam study material can set you up for success.

At BrainDumpsStore, we offer three distinct formats of PCEP - Certified Entry-Level Python Programmer PCEP-30-02 exam questions to cater to diverse learning preferences and lifestyles:

## Desktop Python Institute PCEP-30-02 Practice Exam Software

Our desktop Certified Entry-Level Python Programmer PCEP-30-02 practice test software is a powerful tool to streamline your PCEP-30-02 exam preparation. With customizable features, including difficulty levels and Python Institute PCEP-30-02 question quantity, you can tailor your Certified Entry-Level Python Programmer PCEP-30-02 practice tests to match your specific needs. The simulated PCEP - Certified Entry-Level Python Programmer PCEP-30-02 exam environment closely mirrors the actual PCEP-30-02 exam, boosting your confidence for the actual Certified Entry-Level Python Programmer PCEP-30-02 test day. Our dedicated support team can always assist you, ensuring a smooth studying experience.

BONUS!!! Download part of TestPassed PCEP-30-02 dumps for free: <https://drive.google.com/open?id=1fmKbkoExM91JBsT6IVkFar9LK8SP4hb>

Our Software version of PCEP-30-02 study materials has the advantage of simulating the real exam. The timing function in this Software of our PCEP-30-02 guide questions helps them adjust their speeds to answer the questions and the function of stimulating the PCEP-30-02 Exam can help the learners adapt themselves to the atmosphere and pace of the exam. Thus the learners can master our PCEP-30-02 practice engine fast, conveniently and efficiently.

Facing the incoming Python Institute PCEP-30-02 Exam, you may feel stained and anxious, suspicious whether you could pass the exam smoothly and successfully. Actually, you must not impoverish your ambition. Our suggestions are never boggle at difficulties. It is your right time to make your mark. Preparation of exam without effective materials is just like a soldier without gun.

## New PCEP-30-02 Test Questions - PCEP-30-02 Training Pdf

The Python Institute PCEP-30-02 Certification is a valuable certificate that is designed to advance the professional career. With the PCEP - Certified Entry-Level Python Programmer (PCEP-30-02) certification exam seasonal professionals and beginners get an opportunity to demonstrate their expertise. The PCEP - Certified Entry-Level Python Programmer certification exam recognizes

successful candidates in the market and provides solid proof of their expertise.

## Python Institute PCEP-30-02 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>Loops: while, for, range(), loops control, and nesting of loops.</li></ul>
Topic 2	<ul style="list-style-type: none"><li>Data Collections: In this section, the focus is on list construction, indexing, slicing, methods, and comprehensions; it covers Tuples, Dictionaries, and Strings.</li></ul>
Topic 3	<ul style="list-style-type: none"><li>Control Flow: This section covers conditional statements such as if, if-else, if-elif, if-elif-else</li></ul>

## Python Institute PCEP - Certified Entry-Level Python Programmer Sample Questions (Q40-Q45):

### NEW QUESTION # 40

Which of the following expressions evaluate to a non-zero result? (Select two answers.)

- A.  $2 ** 3 / A - 2$
- B.  $1 * * 3 / 4 - 1$
- C.  $4 / 2 * * 3 - 2$
- D.  $1 * 4 // 2 ** 3$

**Answer: A,C**

Explanation:

Explanation

In Python, the `**` operator is used for exponentiation, the `/` operator is used for floating-point division, and the `//` operator is used for integer division. The order of operations is parentheses, exponentiation, multiplication/division, and addition/subtraction. Therefore, the expressions can be evaluated as follows:

A).  $2 ** 3 / A - 2 = 8 / A - 2$  (assuming A is a variable that is not zero or undefined)

B).  $4 / 2 * * 3 - 2 = 4 / 8 - 2 = 0.5 - 2 = -1.5$  C.  $1 * * 3 / 4 - 1 = 1 / 4 - 1 = 0.25 - 1 = -0.75$  D.  $1 * 4 // 2 ** 3 = 4 // 8 = 0$  Only expressions A and B evaluate to non-zero results.

### NEW QUESTION # 41

What is the expected output of the following code?

□

- A. `***`
- B. The code produces no output.
- C. `*`
- D. `**`

**Answer: D**

Explanation:

The code snippet that you have sent is a conditional statement that checks if a variable "counter" is less than 0, greater than or equal to 42, or neither. The code is as follows:

```
if counter < 0: print("") elif counter >= 42: print("") else: print("")
```

The code starts with checking if the value of "counter" is less than 0. If yes, it prints a single asterisk ( ) to the screen and exits the statement. If no, it checks if the value of "counter" is greater than or equal to 42. If yes, it prints three asterisks ( ) to the screen and exits the statement. If no, it prints two asterisks ( ) to the screen and exits the statement.

The expected output of the code depends on the value of "counter". If the value of "counter" is 10, as shown in the image, the code will print two asterisks (\*\*) to the screen, because 10 is neither less than 0 nor greater than or equal to 42. Therefore, the correct answer is C. \* \* Reference: [Python Institute - Entry-Level Python Programmer Certification]

### NEW QUESTION # 42

Drag and drop the code boxes in order to build a program which prints Unavailable to the screen.  
(Note: one code box will not be used.)

**Answer:**

Explanation:

### NEW QUESTION # 43

Which of the following functions can be invoked with two arguments?

- A. ☐
- B. ☐
- C. ☒
- D. ☐

**Answer: C**

Explanation:

Explanation

The code snippets that you have sent are defining four different functions in Python. A function is a block of code that performs a specific task and can be reused in the program. A function can take zero or more arguments, which are values that are passed to the function when it is called. A function can also return a value or None, which is the default return value in Python.

To define a function in Python, you use the `def` keyword, followed by the name of the function and parentheses. Inside the parentheses, you can specify the names of the parameters that the function will accept.

After the parentheses, you use a colon and then indent the code block that contains the statements of the function. For example:

```
def function_name(parameter1, parameter2): # statements of the function return value
```

To call a function in Python, you use the name of the function followed by parentheses. Inside the parentheses, you can pass the values for the arguments that the function expects.

The number and order of the arguments must match the number and order of the parameters in the function definition, unless you use keyword arguments or default values. For example:

```
function_name(argument1, argument2)
```

The code snippets that you have sent are as follows:

A) `def my_function(): print("Hello")`

B) `def my_function(a, b): return a + b`

C) `def my_function(a, b, c): return a * b * c`

D) `def my_function(a, b=0): return a - b`

The question is asking which of these functions can be invoked with two arguments. This means that the function must have two parameters in its definition, or one parameter with a default value and one without.

The default value is a value that is assigned to a parameter if no argument is given for it when the function is called. For example, in option D, the parameter `b` has a default value of 0, so the function can be called with one or two arguments.

The only option that meets this criterion is option B. The function in option B has two parameters, `a` and `b`, and returns the sum of them. This function can be invoked with two arguments, such as `my_function(2, 3)`, which will return 5.

The other options cannot be invoked with two arguments. Option A has no parameters, so it can only be called with no arguments, such as `my_function()`, which will print "Hello". Option C has three parameters, `a`, `b`, and `c`, and returns the product of them. This function can only be called with three arguments, such as `my_function(2, 3, 4)`, which will return 24. Option D has one parameter with a default value, `b`, and one without, `a`, and returns the difference of them. This function can be called with one or two arguments, such as `my_function(2)` or `my_function(2, 3)`, which will return 2 or -1, respectively.

Therefore, the correct answer is B. Option B.

### NEW QUESTION # 44

What is the expected output of the following code?

- A. The code raises an unhandled exception.
- B. ('Fermi', '2021', 'False')
- C. 0
- D. False

**Answer: B**

Explanation

```
def runner(brand, model, year): return (brand, model, year)
```

The code starts with defining a function called "runner" with three parameters: "brand", "model", and "year".

Then, the code calls the function "runner" with the value "Fermi" for the "brand" parameter and prints the result. However, the function expects three arguments, but only one is given. This will cause a `TypeError` exception, which is an error that occurs when a function or operation receives an argument that has the wrong type or number. The code does not handle the exception, and therefore it will terminate with an error message.

Therefore, the correct answer is D. ('Fermi', '2021', 'False').
