We can claim that prepared with our EMEA-Advanced-Support study materials for 20 to 30 hours, you can easily pass the EMEA-Advanced-Support exam and get your expected score. Also we offer free demos of our EMEA-Advanced-Support exam questions for you to check out the validity and precise of our EMEA-Advanced-Support Training Materials. Just come and have a try! You will be surprised to find the high accuracy of our EMEA-Advanced-Support training material. And as our high pass rate of EMEA-Advanced-Support practice braindump is 99% to 100%, you will pass the exam easily.

## Fortinet EMEA Advanced Support Exam Sample Questions (Q26-Q31):

### NEW QUESTION # 26

Link aggregation allows network devices to \_\_\_\_\_

- A. Increase bandwidth by binding physical interfaces into a single channel
- B. Restrict the bandwidth
- C. Increase bandwidth of an interface
- D. None of the above

**Answer: A**

Explanation:

Link aggregation, also known as IEEE 802.3ad or 802.1ax, enables the binding of multiple physical interfaces to form a single logical interface, which increases the overall bandwidth and provides redundancy. This is achieved by combining the bandwidth of the individual links into one aggregated link. For example, if two 1Gbps interfaces are aggregated, the logical link can provide up to 2Gbps bandwidth. This configuration is commonly used in FortiGate devices to enhance network performance without replacing hardware. The option B correctly describes this by stating "Increase bandwidth by binding physical interfaces into a single channel," which aligns with the official description. Incorrect options include A, which is vague and does not specify the method of binding multiple interfaces; C, which is the opposite of the purpose; and D, which is invalid.

Exact extract: Link aggregation (IEEE 802.3ad/802.1ax) enables you to bind two or more physical interfaces together to form an aggregated (combined) link. This new link ... Link aggregation combines multiple physical interfaces into a single logical interface, increasing bandwidth and link redundancy. Traffic is distributed evenly.

### NEW QUESTION # 27

Which of the below technology(ies) could reduce CPU load and memory utilization used by an IPS engine?

- A. Using multiple engines, aligned with load balancing technologies like Turbo that uses round robin algorithms to dispatch traffic up to specific IPS engine
- B. Using regular instead of extended database, to reduce memory footprint
- C. Using IPS sensors and IPS filter to determine which traffic should be examined for which signatures, instead of examine network traffic for all signatures
- D. IPS does not compare traffic to each signature individually. Instead it compiles them into a decision tree
- E. All of the above

**Answer: B,C,D**

Explanation:

IPS efficiency is improved by: A) Compiling signatures into a decision tree to reduce comparison overhead; B) Using IPS sensors/filters to selectively apply signatures to relevant traffic, reducing unnecessary processing; D) Using a regular database instead of an extended one to lower memory usage. Option C's

"Turbo" and round-robin load balancing is not a standard Fortinet IPS feature. Option E is incorrect as C is not valid. Exact extract: "IPS efficiency is improved by compiling signatures into decision trees to minimize CPU usage... IPS sensors and filters allow selective signature application to reduce processing... Using the regular signature database instead of extended reduces memory footprint."

### NEW QUESTION # 28

Which protocol does FortiGate use for secure management access by default?

- A. SNMP
- B. SSH
- C. Telnet

- D. HTTP

**Answer: B**

Explanation:

FortiGate uses SSH (Secure Shell) by default for secure management access, providing encrypted command-line access. Telnet (A) and HTTP (C) are insecure, and SNMP (D) is for monitoring, not management. Exact extract: "FortiGate enables SSH by default for secure management access, providing encrypted CLI access to administrators."

#### NEW QUESTION # 29

Which of these BGP paths will be the preferred one ?

- A. Prefer the path with the shortest AS Path
- **B. Prefer the path with the highest Local Preference value**
- C. Prefer the path with the lowest Multi-Exit Discriminator (MED)
- D. Prefer External path (learned via EBGP) over Internal path (IBGP)

**Answer: B**

Explanation:

BGP path selection follows a specific order of attributes to determine the best path. The process prefers the path with the highest local preference first, as it is one of the earliest steps in the decision process. Local preference is used within an AS to influence outbound traffic. Only if local preferences are equal does it move to the next criteria, such as shortest AS path. The AS path length is considered after local preference, MED after that, and eBGP over iBGP even later. Therefore, among the options, the highest local preference (D) is the most preferred criterion. The original document's answer B is incorrect based on standard BGP selection rules implemented in Fortinet. Exact extract: This article describes the BGP route selection process. Scope FortiGate. Solution Consider only routes with no AS loops and a valid next hop. BGP makes routing decisions based on path, network policies and rule sets ... select the route with the lowest router ID as the best path. Network. Type. To achieve this, multiple route selection techniques can be used. Some are protocol-agnostic (for example, weight) and others are protocol-specific (for example ...).

#### NEW QUESTION # 30

Which protocols are used by an email client to retrieve emails?

- A. SNMP
- **B. POP3**
- **C. IMAP4**
- D. SMTP

**Answer: B,C**

Explanation:

Email clients use POP3 (Post Office Protocol) and IMAP4 (Internet Message Access Protocol) to retrieve emails from a server. POP3 downloads emails and typically removes them from the server, while IMAP4 allows synchronized access. SMTP is used for sending emails, and SNMP is for network monitoring, not email retrieval. Exact extract: "Email clients use POP3 or IMAP to retrieve email messages from a mail server... IMAP allows users to access and manage email directly on the server, while POP3 typically downloads messages to the client."
