## 156-315.82 Reliable Exam Registration & Valid 156-315.82 Exam Labs

The online version is open to any electronic equipment, at the same time, the online version of our 156-315.82 study materials can also be used in an offline state. You just need to use the online version at the first time when you are in an online state; you can have the right to use the version of our 156-315.82 Study Materials offline. And if you are willing to take our 156-315.82 study materials into more consideration, it must be very easy for you to pass your 156-315.82 exam in a short time.

## CheckPoint Check Point Certified Security Expert - R82 Sample Questions (Q80-Q85):

### NEW QUESTION # 80

Can a VPN Gateway be a member of more than one VPN Community?

- A. Yes, it is possible, but with correct modifications of the vpn\_route.conf file on each VPN Gateway.
- B. Yes, it can be used in more than one VPN Community if all VPN Gateways are managed with the same Security

Management Server.

- C. Yes, if it does not pair with another VPN Gateway in more than one VPN Community.
- D. No, it can be used only in one VPN.

**Answer: C**

Explanation:

The correct answer is C. A Check Point Security Gateway can participate in more than one VPN Community, but the important design restriction is that the same VPN peer relationship must not be duplicated ambiguously across multiple communities. R82 documentation explicitly supports a Security Gateway participating in more than one VPN Community and even allows a different VPN Domain per community, also called Encryption Domain per VPN Community. That feature exists because one gateway may need to connect to different partners or logical VPN environments using different encryption domains. Option A is therefore false. Option B is wrong because `vpn_route.conf` is used for VPN routing scenarios, not as the basic condition that allows multi-community membership. Option D is too broad; shared management alone is not the deciding condition. The safe exam interpretation is: yes, a gateway can be in multiple VPN Communities, provided it does not create duplicate/ambiguous peer pairing across more than one community. Reference topic: Specific VPN Domain for Gateway Communities / VPN Domain Advanced Configuration.

#### NEW QUESTION # 81

What is the CLI command to check the Deployment Agent Built Number?

- A. `show deployment agent -v`
- B. `show deployment agent --version`
- C. `show installer version`
- D. `show installer status`

**Answer: B**

Explanation:

The command `show deployment agent --version` is used in CLI to display the build number and version information of the Check Point Deployment Agent installed on the system.

#### NEW QUESTION # 82

Which statement is WRONG regarding the usage of the Central Deployment in SmartConsole?

- A. You can upgrade your cluster without user intervention with the Central Deployment in SmartConsole from R80.40 to R81.20.
- B. You can install Hotfixes with the Central Deployment in SmartConsole
- C. Only Hotfixes can be installed with the Central Deployment in SmartConsole
- D. You can install Jumbo Hotfix accumulators with the Central Deployment in SmartConsole.

**Answer: C**

#### NEW QUESTION # 83

Which of the following is a trigger for synchronization between Active and Standby servers?

- A. After 10 seconds of inactivity in SmartConsole.
- B. Publishing a session in SmartConsole.
- C. Making a change in a network object and clicking OK.
- D. Running the Save operation from the SmartConsole toolbar or menu.

**Answer: B**

Explanation:

The correct answer is A. In Check Point R82 Management High Availability, synchronization occurs at intervals and when the administrator publishes the SmartConsole session. This distinction matters because SmartConsole changes are not fully committed to the management database until they are published. Simply editing an object and clicking OK saves the change inside the current

private session, but that unpublished session is not synchronized to Standby Management Servers. The R82 guide explicitly states that the Active server synchronizes with Standby servers at intervals and when the session is published, and that sessions not published are not synchronized. Option B is therefore incomplete because clicking OK on an object does not equal a publish operation. Option C uses old-style "save" terminology and is not the R80+ publishing model. Option D is fabricated; there is no 10-second inactivity synchronization trigger. For CCSE purposes, the key trigger to remember is Publish, not object edit completion. Reference topic: Synchronizing Active and Standby Servers.

---

#### NEW QUESTION # 84

In Management HA, changes in policy and object are performed through the active server. What happens if the active server fails or is taken offline?

- A. A changeover can be initiated manually to make a standby server become active
- B. The closest standby server will immediately become active within 3 seconds
- C. The standby server with the highest priority set by the administrator automatically becomes active
- D. One of the standby servers must be promoted to Primary Management Server to make it active

**Answer: A**

Explanation:

In Management High Availability, failover is manual by default, so if the active server fails or is taken offline, an administrator must manually initiate a changeover to promote a standby server to become the active server.

#### NEW QUESTION # 85

.....

In the 21 Century, the {Examcode} certification became more and more recognized in the society because it represented the certain ability of examinees. However, in order to obtain {Examcode} certification, you have to spend a lot of time preparing for the 156-315.82 exam. Many people gave up because of all kinds of difficulties before the examination, and finally lost the opportunity to enhance their self-worth. As a thriving multinational company, we are always committed to solving this problem. For example, the 156-315.82 Learning Engine we developed can make the 156-315.82 exam easy and easy, and we can confidently say that we did this.
