PassSureExam offers real Google Professional-Cloud-DevOps-Engineer Questions that can solve this trouble for students. Professionals have made the Google Professional-Cloud-DevOps-Engineer questions of PassSureExam after working days without caring about themselves to provide the applicants with actual Professional-Cloud-DevOps-Engineer exam questions PassSureExam guarantees our customers that they can pass the Google Cloud Certified - Professional Cloud DevOps Engineer Exam (Professional-Cloud-DevOps-Engineer) exam on the first try by preparing from PassSureExam, and if they fail to pass it despite their best efforts, they can claim their payment back according to some terms and conditions.

With the intense competition in labor market, it has become a trend that a lot of people, including many students, workers and so on, are trying their best to get a Professional-Cloud-DevOps-Engineer certification in a short time. They all long to own the useful certification that they can have an opportunity to change their present state, but they also understand that it is not easy for them to get a Professional-Cloud-DevOps-Engineer Certification in a short time. If you are the one of the people who wants to pass the Professional-Cloud-DevOps-Engineer exam and get the certificate, we are willing to help you solve your problem with our wonderful Professional-Cloud-DevOps-Engineer study guide.

Excellent Valid Exam Professional-Cloud-DevOps-Engineer Vce Free & Leading Offer in Qualification Exams & Top New Professional-Cloud-DevOps-Engineer Exam Bootcamp

PassSureExam is committed to offering the best value for your investment. For this purpose, PassSureExam is offering a 100 percent Professional-Cloud-DevOps-Engineer Exams passing money-back guarantee. Whether you buy Google Cloud Certified - Professional Cloud DevOps Engineer Exam Professional-Cloud-DevOps-Engineer Pdf Dumps file, desktop practice test software, and web-based practice test software or all formats, your investment is secured.

Google Cloud Certified - Professional Cloud DevOps Engineer Exam Sample Questions (Q184-Q189):

NEW QUESTION # 184

You support a popular mobile game application deployed on Google Kubernetes Engine (GKE) across several Google Cloud regions. Each region has multiple Kubernetes clusters. You receive a report that none of the users in a specific region can connect to the application. You want to resolve the incident while following Site Reliability Engineering practices. What should you do first?

- A. Use Stackdriver Monitoring to check for a spike in CPU or memory usage for the affected region.
- B. Add an extra node pool that consists of high memory and high CPU machine type instances to the cluster.
- C. Reroute the user traffic from the affected region to other regions that don't report issues.
- D. Use Stackdriver Logging to filter on the clusters in the affected region, and inspect error messages in the logs.

Answer: D

NEW QUESTION # 185

You support an application running on GCP and want to configure SMS notifications to your team for the most critical alerts in Stackdriver Monitoring. You have already identified the alerting policies you want to configure this for. What should you do?

- A. Configure a Slack notification for each alerting policy. Set up a Slack-to-SMS integration to send SMS messages when Slack messages are received. Ensure that your team members add their SMS/phone numbers to the external integration.
- B. Download and configure a third-party integration between Stackdriver Monitoring and an SMS gateway. Ensure that your team members add their SMS/phone numbers to the external tool.
- C. Select the Webhook notifications option for each alerting policy, and configure it to use a third-party integration tool. Ensure that your team members add their SMS/phone numbers to the external tool.
- D. Ensure that your team members set their SMS/phone numbers in their Stackdriver Profile. Select the SMS notification option for each alerting policy and then select the appropriate SMS/phone numbers from the list.

Answer: D

NEW QUESTION # 186

Your organization is using Helm to package containerized applications. Your applications reference both public and private charts. Your security team flagged that using a public Helm repository as a dependency is a risk. You want to manage all charts uniformly, with native access control and VPC Service Controls. What should you do?

- A. Store public and private charts by using Git repository. Configure Cloud Build to synchronize contents of the repository into a Cloud Storage bucket. Connect Helm to the bucket by using [https://\[bucket\].storage.googleapis.com/\[helmchart\]](https://[bucket].storage.googleapis.com/[helmchart]) as the Helm repository.
- B. Configure a Helm chart repository server to run in Google Kubernetes Engine (GKE) with Cloud Storage bucket as the storage backend.
- C. Store public and private charts by using GitHub Enterprise with Google Workspace as the identity provider.
- D. Store public and private charts in OCI format by using Artifact Registry

Answer: D

Explanation:

The best option for managing all charts uniformly, with native access control and VPC Service Controls is to store public and private charts in OCI format by using Artifact Registry. Artifact Registry is a service that allows you to store and manage container images and other artifacts in Google Cloud. Artifact Registry supports OCI format, which is an open standard for storing container images and other artifacts such as Helm charts. You can use Artifact Registry to store public and private charts in OCI format and manage them uniformly. You can also use Artifact Registry's native access control features, such as IAM policies and VPC Service Controls, to secure your charts and control who can access them.

NEW QUESTION # 187

You are configuring Cloud Logging for a new application that runs on a Compute Engine instance with a public IP address. A user-managed service account is attached to the instance. You confirmed that the necessary agents are running on the instance but you cannot see any log entries from the instance in Cloud Logging. You want to resolve the issue by following Google-recommended practices. What should you do?

- A. Enable Private Google Access on the subnet that the instance is in.
- B. Export the service account key and configure the agents to use the key.
- **C. Add the Logs Writer role to the service account.**
- D. Update the instance to use the default Compute Engine service account.

Answer: C

Explanation:

Explanation

The correct answer is A. Add the Logs Writer role to the service account.

To use Cloud Logging, the service account attached to the Compute Engine instance must have the necessary permissions to write log entries. The Logs Writer role (roles/logging.logWriter) provides this permission. You can grant this role to the user-managed service account at the project, folder, or organization level.

Private Google Access is not required for Cloud Logging, as it allows instances without external IP addresses to access Google APIs and services². The default Compute Engine service account already has the Logs Writer role, but it is not a recommended practice to use it for user applications³. Exporting the service account key and configuring the agents to use the key is not a secure way of authenticating the service account, as it exposes the key to potential compromise⁴.

NEW QUESTION # 188

Your team has recently deployed an NGINX-based application into Google Kubernetes Engine (GKE) and has exposed it to the public via an HTTP Google Cloud Load Balancer (GCLB) ingress. You want to scale the deployment of the application's frontend using an appropriate Service Level Indicator (SLI). What should you do?

- **A. Install the Stackdriver custom metrics adapter and configure a horizontal pod autoscaler to use the number of requests provided by the GCLB.**
- B. Configure the vertical pod autoscaler in GKE and enable the cluster autoscaler to scale the cluster as pods expand.
- C. Configure the horizontal pod autoscaler to use the average response time from the Liveness and Readiness probes.
- D. Expose the NGINX stats endpoint and configure the horizontal pod autoscaler to use the request metrics exposed by the NGINX deployment.

Answer: A

Explanation:
