They are in fact made, keeping in mind the SAFe-Practitioner Actual Exam. Thus every SAFe-Practitioner exam dumps is set in line with the format of real exam and introduces the candidate to it perfectly.

Scrum SAFe Practitioner Exam (6.0) Sample Questions (Q136-Q141):

NEW QUESTION # 136

Persona is a profile of a product's typical customer.

- A. TRUE
- B. FALSE

Answer: A

NEW QUESTION # 137

What is one of the Lean budget Guardrails?

- A. Objective measurements
- B. Continuous Business Owner engagement
- C. Spending caps for each ART
- D. Participatory budgeting

Answer: B

Explanation:

This statement is one of the Lean budget Guardrails, which describe the policies and practices for budgeting, spending, and governance for a specific portfolio¹. Continuous Business Owner engagement means that the Business Owners, who are key stakeholders for each Agile Release Train (ART), are actively involved in the planning, execution, and review of the value delivery¹. They provide feedback, guidance, and approval for the PI objectives, features, and enablers, as well as participate in the Inspect and Adapt (I&A) workshop and the Program Increment (PI) system demo². Continuous Business Owner engagement helps ensure alignment, transparency, and accountability for the value streams and ARTs¹. References: Lean Budget Guardrails, Business Owners

NEW QUESTION # 138

Which of the following categories addresses potential risks?

- A. Resolved
- B. Acquired
- C. Supervised
- D. Obtained

Answer: A

Explanation:

In SAFe 6.0, during PI Planning, program risks are identified, categorized, and addressed in a process called the ROAM technique. ROAM stands for Resolved, Owned, Accepted, and Mitigated.

* Resolved means the risk has been addressed and is no longer a concern.

* Owned means someone takes responsibility for managing the risk.

* Accepted means the risk is acknowledged and will be monitored.

* Mitigated means steps are taken to reduce the impact or likelihood of the risk.

Thus, the correct category that addresses potential risks is Resolved (option A).

NEW QUESTION # 139

Who create and refines User Stories and acceptance Criteria?

- A. Project Manager
- **B. Agile Team**
- C. Product Owner
- D. Scrum Master

Answer: B

NEW QUESTION # 140

How can trust be gained between the business and development?

- A. Automate the delivery pipeline
- B. Maintain Iterations as a safe zone
- **C. Deliver predictability**
- D. Release new value to production every day

Answer: C

Explanation:

Trust is the foundation of any successful collaboration, especially between the business and development teams, who often have different perspectives, expectations, and incentives. Trust exists when everyone can confidently rely on one another to act with integrity, particularly in times of difficulty. Without trust, it is impossible to build high-performing teams and teams or build (or rebuild) the confidence needed to make and meet reasonable commitments¹. One way to gain trust between the business and development is to deliver predictability, which means that the teams and the Agile Release Train (ART) can consistently deliver value in the shortest sustainable lead time, with the best quality and value, and meet the agreed-upon objectives and goals². Predictability is achieved by applying the SAFe principles and practices, such as aligning to a common mission and vision, planning and executing in iterations and increments, applying systems thinking and feedback loops, and embracing change and innovation³. Predictability helps to establish and maintain trust between the business and development, as it demonstrates the reliability, transparency, and accountability of the teams and the ART, and it enables the business to make informed decisions and provide timely feedback⁴. The other options are not the best ways to gain trust between the business and development, as they either do not address the core issue of trust, or they may have negative consequences. Automating the delivery pipeline is a technical practice that supports DevOps and continuous delivery, and it can improve the speed, quality, and efficiency of the value delivery, but it does not necessarily build trust between the business and development, as it does not address the communication, collaboration, and alignment aspects of trust.

Releasing new value to production every day is a desirable outcome of DevOps and continuous delivery, and it can provide fast feedback and validation of the value delivered, but it does not guarantee trust between the business and development, as it may also introduce risks, errors, and instability, and it may not reflect the actual needs and expectations of the customers and stakeholders.

Maintaining iterations as a safe zone is a practice that protects the teams from external interference and distractions during the iteration execution, and it can help the teams focus on their work and deliver value, but it does not foster trust between the business and development, as it may also create silos, isolation, and resistance to change, and it may prevent the teams from collaborating and communicating with the business and other teams.
