Study SOA-C02 Plan & Practice SOA-C02 Exam Online

We all know the effective diligence is in direct proportion to outcome, so by years of diligent work, our experts have collected the frequent-tested knowledge into our SOA-C02 practice materials for your reference. So our SOA-C02 training materials are triumph of their endeavor. By resorting to our SOA-C02 practice materials, we can absolutely reap more than you have imagined before. We have clear data collected from customers who chose our SOA-C02 actual tests, the passing rate is 98% percent. So your chance of getting success will be increased greatly by our SOA-C02 materials.

Amazon AWS Certified SysOps Administrator - Associate (SOA-C02) Sample Questions (Q207-Q212):

NEW QUESTION # 207
A company has an initiative to reduce costs associated with Amazon EC2 and AWS Lambda. Which action should a SysOps administrator take to meet these requirements?

- A. Create an AWS Budgets alert to alarm when account spend reaches 80% of the budget.
- B. Analyze the AWS Cost and Usage Report by using Amazon Athena to identity cost savings.
- C. Use AWS Compute Optimizer and take action on the provided recommendations.
- D. Purchase Reserved Instances through the Amazon EC2 console.

Answer: C

Explanation:
AWS Compute Optimizer recommends optimal AWS resources for your workloads to reduce costs and improve performance. It provides actionable recommendations to help you choose the right EC2 instances and AWS Lambda configurations.
* Access AWS Compute Optimizer:
* Open the AWS Compute Optimizer console at AWS Compute Optimizer Console.
* Review the recommendations for your EC2 instances and AWS Lambda functions.
* Implement Recommendations:
* Analyze the recommendations, which might include resizing instances, changing instance types, or modifying Lambda memory settings.
* Apply the recommendations to optimize your resources and reduce costs.

Getting Started with AWS Compute Optimizer

NEW QUESTION # 208
The SysOps administrator needs to resolve high disk I/O issues during the bootstrap process of Nitro-based EC2 instances in an Auto Scaling group with gp3 EBS volumes.
Options (Select TWO):

- A. Increase the EBS volume throughput.
- B. Change the instance type to an instance that is not Nitro-based.
- C. Increase the EBS volume IOPS.
- D. Increase the EC2 instance size.
- E. Increase the EBS volume capacity.

Answer: A,C

Explanation:
To address high I/O requirements during the bootstrap process, increasing both IOPS and throughput on the EBS volume is recommended:
Increase EBS Volume IOPS: Enhances the instance's ability to handle multiple read and write operations per second, essential for data-heavy tasks like downloading Docker images.
Increase EBS Volume Throughput: Provides higher data transfer rates, reducing bottlenecks during intensive I/O operations.
Increasing instance size is unnecessary if the primary issue is disk I/O, and changing from Nitro-based instances would not address the underlying storage performance need.

NEW QUESTION # 209
A company wants to be alerted through email when IAM CreateUser API calls are made within its AWS account.
Which combination of actions should a SysOps administrator take to meet this requirement?
(Choose two.)

- A. Create an Amazon EventBridge (Amazon CloudWatch Events) rule with AWS CloudTrail as the event source and IAM CreateUser as the specific API call for the event pattern.
- B. Create an Amazon EventBridge (Amazon CloudWatch Events) rule with AWS IAM Access Analyzer as the event source and IAM CreateUser as the specific API call for the event pattern.
- C. Use an Amazon Simple Notification Service (Amazon SNS) topic as an event target with an email subscription.
- D. Create an Amazon EventBridge (Amazon CloudWatch Events) rule with Amazon CloudSearch as the event source and IAM CreateUser as the specific API call for the event pattern.
- E. Use an Amazon Simple Email Service (Amazon SES) notification as an event target with an email subscription.

Answer: A,C

NEW QUESTION # 210
A company hosts a web application on Amazon EC2 instances behind an Application Load Balancer (ALB).
The company uses Amazon Route 53 to route traffic.
The company also has a static website that is configured in an Amazon S3 bucket.

A SysOps administrator must use the static website as a backup to the web application. The failover to the static website must be fully automated.
Which combination of actions will meet these requirements? (Choose two.)

- A. Create an AWS Lambda function to switch from the primary website to the secondary website when the health check fails.
- B. Create a primary failover routing policy record. Configure the value to be the ALB. Associate the record with a Route 53 health check.
- C. Create a secondary failover routing policy record. Configure the value to be the static website.
- D. Create a primary failover routing policy record. Configure the value to be the ALB.
- E. Create a secondary failover routing policy record. Configure the value to be the static website.
  Associate the record with a Route 53 health check.

Answer: B,D

Explanation:
To use the static website as a backup to the web application and ensure automated failover, the SysOps administrator should set up failover routing policies in Amazon Route 53.
* Failover Routing Policies:
* Route 53 failover routing allows you to route traffic to a primary resource when it is healthy and automatically failover to a secondary resource when the primary becomes unhealthy.
* Steps to Implement:
* Primary Failover Record: Create a primary failover routing policy record and set the value to the ALB. Associate this record with a Route 53 health check that monitors the ALB.
* Secondary Failover Record: Create a secondary failover routing policy record and set the value to the static website.
Amazon Route 53 Failover Routing

NEW QUESTION # 211

A company plans to launch a static website on its domain example com and subdomain www example.com using Amazon S3. How should the SysOps administrator meet this requirement?

- A. Create two S3 buckets named example.com and www.exdmpte.com. Configure the subdomain bucket to redirect requests to the domain bucket.
- B. Create one S3 bucket with a wildcard named '.example.com tor both the domain and subdomain.
- C. Create one S3 bucket named example.com for both the domain and subdomain.
- D. Create two S3 buckets named http//example.com and http//" exampte.com. Configure the wildcard (') bucket to redirect requests to the domain bucket.

Answer: A
