Snowflake SnowPro Core Certification Exam Sample Questions (Q199-Q204):

NEW QUESTION # 199

What are characteristics of transient tables in Snowflake? (Select TWO).

- A. Transient tables have a Fail-safe period of 7 days.
- **B. Transient tables can be cloned to permanent tables.**
- C. Transient tables can be altered to make them permanent tables.
- **D. Transient tables persist until they are explicitly dropped.**
- E. Transient tables have Time Travel retention periods of 0 or 1 day.

Answer: B,D

NEW QUESTION # 200

Which function returns an integer between 0 and 100 when used to calculate the similarity of two strings?

- A. APPROXIMATE_JACCARD_INDEX
- **B. JAROWINKLER_SIMILARITY**
- C. MINHASH_COMBINE
- D. APPROXIMATE_SIMILARITY

Answer: B

Explanation:

The `JAROWINKLER_SIMILARITY` function in Snowflake returns an integer between 0 and 100, indicating the similarity of two strings based on the Jaro-Winkler similarity algorithm. This function is useful for comparing strings and determining how closely they match each other.

Understanding JAROWINKLER_SIMILARITY: The Jaro-Winkler similarity metric is a measure of similarity between two strings. The score is a number between 0 and 100, where 100 indicates an exact match and lower scores indicate less similarity.

Usage Example: To compare two strings and get their similarity score, you can use:

`SELECT JAROWINKLER_SIMILARITY('string1', 'string2') AS similarity_score;` **Application Scenarios:** This function is particularly useful in data cleaning, matching, and deduplication tasks where you need to identify similar but not identical strings, such as names, addresses, or product titles.

Reference: For more detailed information on the `JAROWINKLER_SIMILARITY` function and its usage, refer to the Snowflake documentation on string functions: https://docs.snowflake.com/en/sql-reference/functions/jarowinkler_similarity.html

NEW QUESTION # 201

What is a User-Defined Table Function, or UDTF, used for in Snowflake?

- A. To return one output row as a single column or value for each input row.
- B. To process input rows as pandas DataFrames and return tabular results.
- **C. To return a tabular value for each input row.**
- D. To process input rows and return the results as a pandas series.

Answer: C

Explanation:

The correct answer is A. To return a tabular value for each input row.

A User-Defined Table Function, or UDTF, returns a set of rows instead of a single scalar value. This is different from a scalar UDF, which returns one value for each input row.

Why A is correct:

A UDTF produces tabular output. It can return multiple rows and multiple columns, depending on how the function is defined.

Example concept:

SELECT *

FROM TABLE(my_udtf(input_column));

This syntax shows that the function result is treated like a table.

Why the other options are incorrect:

B). Returning a pandas Series is associated with vectorized Python UDF behavior, not the general definition of a UDTF.

C). Returning one output row as a single column or value describes a scalar UDF, not a table function.

D). Processing input rows as pandas DataFrames is associated with Snowpark Python and vectorized processing patterns, but it is not the basic Snowflake definition of a UDTF.

Official Snowflake documentation reference:

Snowflake documentation defines a UDTF as a user-defined function that returns tabular results. It can return multiple rows for each input row.

NEW QUESTION # 202

Which features make up Snowflake's column level security? (Select TWO).

- A. Row access policies
- B. Key pair authentication
- C. Continuous Data Protection (CDP)
- D. External Tokenization
- E. Dynamic Data Masking

Answer: A,E

NEW QUESTION # 203

True or False: A Virtual Warehouse can be resized while suspended.

- A. True
- B. False

Answer: A

Explanation:

Virtual Warehouses in Snowflake can indeed be resized while they are suspended. Resizing a warehouse involves changing the number of compute resources (servers) allocated to it, which can be done to adjust performance and cost. When a warehouse is suspended, it is not currently running any queries, but its definition and metadata remain intact, allowing for modifications like resizing. Reference:<https://docs.snowflake.com/en/user-guide/warehouses-tasks.html#effects-of-resizing-a-suspended-war>
