Managing Cloud Security - C838 Exam with Complete Answers

Broad network access - Answer-There should never be network bandwidth bottlenecks.

On-demand services - Answer-Refers to the model that allows customers to scale their compute and/or storage needs with little or no intervention from or prior communication with the provider.

Resource pooling - Answer-Characteristic that allows the cloud provider to meet various demands from customers while remaining financially viable.

measured/metered service - Answer-The customer is charged for only what they use and nothing more.

Business Impact Analysis (BIA) - Answer-An assessment of the priorities given to each asset and process within the organization

personally identifiable information (PII) - Answer-Under current laws, no cloud customer can transfer risk or liability associated with the inadvertent or malicious disclosure of <blank>.

Elasticity - Answer-This is the flexibility of allocating resources as needed for immediate usage, instead of purchasing resources according to other variables.

Simplicity - Answer-Usage and administration of cloud services ought to be transparent to cloud customers and users; from their perspective, a digital data service is paid for and can be used, with very little additional input other than what is necessary to perform their duties.

Scalability - Answer-The organization's computing needs won't remain static; there will be new (and hopefully more) users, customers, and data as the organization continually matures.

Infrastructure as a Service (IaaS) - Answer-The most basic of cloud service offerings, <blank> allows the customer to install all software, including operating systems (OSs) on hardware housed and connected by the cloud vendor.

Platform as a Service (PaaS) - Answer-<Blank> contains everything included in IaaS, with the addition of OSs.

Software as a Service (SaaS) - Answer-The cloud vendor becomes responsible for administering, patching, and updating software as well.

PDFBraindumps believes in customer satisfaction and strives hard to make the entire WGU Managing-Cloud-Security exam preparation process simple, smart, and successful. These WGU Managing-Cloud-Security exam questions formats are WGU Managing-Cloud-Security Pdf Dumps file, desktop practice test software and web-based practice test software. All these three PDFBraindumps's WGU Managing-Cloud-Security exam dumps formats contain the real and updated Managing-Cloud-Security practice test.

The content system of Managing-Cloud-Security exam simulation is constructed by experts. After-sales service of our Managing-Cloud-Security study materials is also provided by professionals. If you encounter some problems when using our products, you can also get them at any time. After you choose Managing-Cloud-Security preparation questions, professional services will enable you to use it in the way that suits you best, truly making the best use of it, and bringing you the best learning results. Our Managing-Cloud-Security Study Materials have a professional attitude at the very beginning of its creation for you to get your certification.

WGU Managing-Cloud-Security Printable PDF & Latest Managing-Cloud-Security Test Cram

The candidates can benefit themselves by using our Managing-Cloud-Security test engine and get a lot of test questions like exercises and answers. Our Managing-Cloud-Security exam questions will help them modify the entire syllabus in a short time. And the Software version of our Managing-Cloud-Security Study Materials have the advantage of simulating the real exam, so that the candidates have more experience of the practicing the real exam questions.

WGU Managing Cloud Security (JY02) Sample Questions (Q156-Q161):

NEW QUESTION # 156

Which guide remedies the challenge of the international nature of cloud forensics and is known for becoming the premier standard for eDiscovery?

- A. ISO/IEC 27037:2012
- **B. ISO/IEC 27050-1:2016**
- C. ISO/IEC 27041:2015
- D. ISO/IEC 27042:2015

Answer: B

Explanation:

ISO/IEC 27050-1:2016 is the guide that addresses the international challenges of cloud forensics and is recognized as the premier standard for electronic discovery (eDiscovery). Managing Cloud documentation explains that eDiscovery involves identifying, collecting, preserving, and producing electronically stored information in legal proceedings.

This standard provides guidance for handling digital evidence across jurisdictions, which is especially important in cloud environments where data may reside in multiple countries. It establishes consistent processes and terminology to support legal defensibility and compliance.

The other ISO standards address evidence handling, investigation readiness, or incident management, but ISO /IEC 27050 specifically focuses on eDiscovery. Therefore, ISO/IEC 27050-1:2016 is the correct answer.

NEW QUESTION # 157

Which logical consideration should be addressed when planning the design of a data center?

- A. Heating and cooling
- B. Utility power availability
- C. Ability for expansion
- **D. Multitenancy of networks**

Answer: D

Explanation:

Multitenancy of networks is a logical design consideration when planning a data center. Managing Cloud principles explain that logical considerations focus on how systems, networks, and services are structured and interact, rather than physical infrastructure components.

Multitenancy requires logical separation of tenants to ensure confidentiality, integrity, and availability of data.

This includes network segmentation, virtual LANs, access controls, and isolation mechanisms that prevent one tenant from accessing another tenant's resources. Proper logical design is critical in cloud environments where multiple customers share the same physical infrastructure.

The other options represent non-logical considerations. Heating and cooling and utility power availability are physical and environmental concerns, while ability for expansion relates to physical capacity planning.

Therefore, multitenancy of networks is the correct logical consideration.

NEW QUESTION # 158

Which threat modeling process would a security analyst use to test a new application from a malicious actor's perspective?

- **A. Process for Attack Simulation and Threat Analysis (PASTA)**
- B. Damage, Reproducibility, Exploitability, Affected Users, and Discoverability (DREAD)
- C. Spoofing, Tampering, Repudiation, Information Disclosure, Denial of Service, and Elevation of Privileges (STRIDE)
- D. Architecture, Threats, Attack Surfaces, and Mitigation (ATASM)

Answer: A

Explanation:

The Process for Attack Simulation and Threat Analysis (PASTA) is a risk-centric threat modeling methodology that explicitly focuses on simulating real-world attacks from an adversary's perspective. Unlike STRIDE or DREAD, which classify threats and rate severity, PASTA evaluates how an attacker would exploit vulnerabilities step by step.

PASTA has seven stages, including defining objectives, decomposing applications, and simulating attacks.

This methodology helps organizations understand both technical and business risks by looking at the application as an attacker would.

STRIDE categorizes threats, DREAD provides scoring, and ATASM emphasizes architecture and mitigation.

While valuable, they are not primarily attack-simulation frameworks. PASTA enables proactive testing of defenses against realistic adversary behaviors, making it especially relevant in modern cloud and DevSecOps environments.

NEW QUESTION # 159

In most redundant array of independent disks (RAID) configurations, data is stored across different disks.

Which method of storing data is described?

- A. Crypto-shredding
- B. Mapping
- C. Archiving
- **D. Striping**

Answer: D

Explanation:

The method described is striping, which is a technique used in RAID configurations to improve performance and distribute risk.

Striping involves splitting data into smaller segments and writing those segments across multiple disks simultaneously. For example, if a file is divided into four parts, each part is written to a separate disk in the RAID array.

This parallelism enhances input/output (I/O) performance because multiple drives can be accessed at once. It also provides resilience depending on the RAID level. While striping by itself (RAID 0) increases performance but not redundancy, when combined with mirroring or parity (e.g., RAID 5 or RAID 10), it offers both speed and fault tolerance.

The purpose of striping in the data management context is to optimize how data is stored, accessed, and protected. It is fundamentally different from archiving, mapping, or crypto-shredding, as those serve different objectives (long-term storage, logical placement, or secure deletion). Striping is central to high-performance storage systems and supports availability in mission-critical environments.

NEW QUESTION # 160

Which cloud architecture model provides application development services?

- A. Software as a Service (SaaS)
- B. Security as a Service (SECaaS)
- **C. Platform as a Service (PaaS)**
- D. Infrastructure as a Service (IaaS)

Answer: C

Explanation:

Platform as a Service (PaaS) provides application development services in cloud environments. Managing Cloud documentation explains that PaaS delivers development frameworks, programming languages, libraries, databases, and testing tools required to build and deploy applications.

This model eliminates the need to manage infrastructure and operating systems, allowing developers to rapidly create, test, and deploy applications. PaaS also supports scalability and integration with other cloud services.

SaaS delivers completed applications, IaaS provides raw infrastructure, and SECaaS focuses on security services. Therefore, PaaS is the correct model for application development services.

NEW QUESTION # 161
