## Amazon AWS Certified SysOps Administrator - Associate (SOA-C02) Sample Questions (Q458-Q463):

### NEW QUESTION # 458

A company has a high-performance Windows workload. The workload requires a storage volume that provides consistent performance of 10,000 KDPS. The company does not want to pay for additional unneeded capacity to achieve this performance. Which solution will meet these requirements with the LEAST cost?

- A. Use an Amazon Elastic File System (Amazon EFS) file system w/ Max I/O mode.
- **B. Use a General Purpose SSD (gp3) Amazon Elastic Block Store (Amazon EBS) volume that is configured with 10,000 provisioned IOPS.**
- C. Use a Provisioned IOPS SSD (io1) Amazon Elastic Block Store (Amazon EBS) volume that is configured with 10,000 provisioned IOPS
- D. Use an Amazon FSx for Windows File Server file system that is configured with 10,000 IOPS

**Answer: B**

Explanation:

To meet the requirement of consistent performance of 10,000 IOPS with the least cost, the SysOps administrator should use a General Purpose SSD (gp3) Amazon EBS volume:

\* General Purpose SSD (gp3) EBS Volume:

\* The gp3 volume type can be provisioned with the required IOPS without the need for additional capacity, making it a cost-effective solution compared to Provisioned IOPS SSD (io1) volumes.

Reference: Amazon EBS Volume Types

Configuration Steps:

Create a gp3 EBS volume and specify 10,000 IOPS and the required throughput.

Attach the volume to the EC2 instance running the Windows workload.

Reference: Modifying the Size, IOPS, or Throughput of an EBS Volume

### NEW QUESTION # 459

A company has created an AWS CloudFormation template that consists of the AWS::EC2 Instance resource and a custom CloudFormation resource. The custom CloudFormation resource is an AWS Lambda function that attempts to run automation on the Amazon EC2 instance.

During testing, the Lambda function fails because the Lambda function tries to run before the EC2 instance is launched. Which solution will resolve this issue?

- A. Update the Lambda function to use the cfn-response module to send a response to the custom resource.
- B. Use the Fn::If intrinsic function to check for the EC2 instance before the custom resource runs.
- C. Update the custom resource's service token to point to a valid Lambda function.
- **D. Add a DependsOn attribute to the custom resource. Specify the EC2 instance in the DependsOn attribute.**

**Answer: D**

Explanation:

DependsOn Attribute in CloudFormation:

\* The DependsOn attribute in AWS CloudFormation ensures that one resource is created only after another resource has been successfully created. In this case, it ensures that the EC2 instance is fully launched before the custom resource (the Lambda function) is executed.

\* Steps:

\* Update the CloudFormation template to include the DependsOn attribute for the custom resource.

\* Ensure that the custom resource references the EC2 instance.

Resources:

MyEC2Instance:

Type: AWS::EC2::Instance

Properties:

```
# EC2 properties
MyCustomResource:
Type: Custom::MyCustomResource
DependsOn: MyEC2Instance
Properties:
ServiceToken: !GetAtt MyLambdaFunction.Arn
# Other properties
1: AWS CloudFormation DependsOn Attribute
```

#### NEW QUESTION # 460

A company is creating an application that runs on smart TVs and mobile phones. Static images for the application are loaded from an Amazon CloudFront distribution.

The images have large file sizes that result in a poor experience for users of mobile devices. The company has created a set of smaller images for mobile devices.

A SysOps administrator must configure CloudFront to cache different content based on the user's device type. Which solution will meet this requirement?

- **A. Create a CloudFront origin request policy. Include the CloudFront-Is-SmartTV-Viewer header and the CloudFront-Is-Mobile-Viewer header in the origin request settings.**
- B. Configure AWS Amplify to set the CloudFront distribution origin request policy to enable caching of different images for mobile devices.
- C. Create two new CloudFront distributions: one distribution with the smart TV resources, and one distribution with the mobile device resources. Create a CloudFront behavior. Add a policy to send the requests to the correct distribution.
- D. Set the Elemental-MediaTailor-PersonalizedManifests origin request policy on the CloudFront distribution to enable caching of different images depending on the requesting device.

**Answer: A**

Explanation:

Use a CloudFront origin request policy that includes the CloudFront-Is-SmartTV-Viewer and CloudFront-Is-Mobile-Viewer headers. CloudFront sets these headers automatically, letting your origin return (and CloudFront cache) the appropriate image variant per device type.

#### NEW QUESTION # 461

An existing, deployed solution uses Amazon EC2 instances with Amazon EBS General Purpose SSD volumes, an Amazon RDS PostgreSQL database, an Amazon EFS file system, and static objects stored in an Amazon S3 bucket. The Security team now mandates that at-rest encryption be turned on immediately for all aspects of the application, without creating new resources and without any downtime.

To satisfy the requirements, which one of these services can the SysOps administrator enable at-rest encryption on?

- A. RDS PostgreSQL database
- **B. S3 objects within a bucket**
- C. Amazon EFS file systems
- D. EBS General Purpose SSD volumes

**Answer: B**

Explanation:

#### NEW QUESTION # 462

To automatically reboot an EC2 instance when disk usage reaches 100%, a solution with minimal operational overhead is needed. Options:

- **A. Create a CloudWatch alarm for the EC2 instance. Create an Amazon EventBridge event rule that reacts to the CloudWatch alarm and reboots the EC2 instance.**
- B. Create a CloudWatch alarm for the EC2 instance. Create an Amazon Simple Email Service (Amazon SES) notification

that reacts to the CloudWatch alarm and reboots the EC2 instance.

- C. Create an AWS Lambda function to reboot the EC2 instance. Create a CloudWatch alarm that uses Amazon EventBridge to invoke the Lambda function.
- D. Create an AWS Lambda function to reboot the EC2 instance. Use EC2 health checks to invoke the Lambda function.

**Answer: A**

Explanation:

Using a CloudWatch alarm with an EventBridge rule provides an automated, direct way to reboot the EC2 instance without extra components like SES or Lambda. This is a straightforward approach with low operational overhead.
