PECB ISO/IEC 27002 Foundation Exam Sample Questions (Q17-Q22):

NEW QUESTION # 17

What does ISO/IEC 27002 provide?

- A. Guidance for the management of information security risks
- **B. Guidance for the implementation of information security controls**
- C. Requirements for the implementation of information security controls

Answer: B

Explanation:

ISO/IEC 27002:2022 provides guidance for selecting, implementing, and managing information security controls. It is not the certification requirements standard; that role belongs to ISO/IEC 27001. ISO/IEC 27002 supports organizations by explaining the purpose of each control, the implementation guidance, and other related information needed to apply controls appropriately. Its controls are grouped into organizational, people, physical, and technological themes. The standard is intended to be used as a reference when organizations design security measures based on their risks, business needs, legal obligations, contractual requirements, and information security objectives. Therefore, option A is correct because "guidance" is the core function of ISO/IEC 27002. Option B is incorrect because ISO/IEC 27002 does not set mandatory requirements for certification. Option C is related to risk management, but it is not the main purpose of ISO/IEC 27002; risk management guidance is more directly associated with ISO/IEC 27005. ISO/IEC 27002 guides control implementation after risk and control needs are determined. References/Chapters: ISO/IEC 27002:2022, Clause 1 Scope; Clause 4 Structure of the standard; Controls 5-8.

NEW QUESTION # 18

In which group of controls does Control 7.9 Security of assets off-premises belong?

- **A. Physical**
- B. Organizational
- C. Technological

Answer: A

Explanation:

Control 7.9, Security of assets off-premises, belongs to the physical control group. ISO/IEC 27002:2022 organizes controls into four themes: organizational controls, people controls, physical controls, and technological controls. Controls in Clause 7 are physical controls, and Control 7.9 specifically addresses protection of organizational assets when they are outside the organization's premises. This includes laptops, mobile devices, storage media, documents, portable equipment, and other assets used during travel, remote work, home working, customer visits, supplier sites, or field operations. Off-premises use increases physical risk because assets may be exposed to theft, loss, damage, unauthorized viewing, insecure storage, or uncontrolled environments. Although technological measures such as encryption and remote wipe may support this control, the control itself is placed in the physical theme because its focus is the secure handling and protection of assets outside controlled facilities. Option A is incorrect because organizational controls are in Clause 5. Option C is incorrect because technological controls are in Clause 8. References/Chapters: ISO/IEC 27002:2022, Clause 7 Physical controls; Control 7.9 Security of assets off-premises; Clause 4 Structure of the standard.

NEW QUESTION # 19

Which of the following controls aims to ensure the integrity of operational systems and prevent exploitation of technical vulnerabilities?

- A. Control 8.19 Installation of software on operational systems
- B. Control 8.15 Logging
- C. Control 8.17 Clock synchronization

Answer: A

NEW QUESTION # 20

According to Control 5.1 Policies for information security, regarding which of the following, among others, should an information security policy contain statements?

- A. Regarding the procedures for using automated information systems
- B. Regarding the procedures for recovering from a data breach
- C. Regarding the procedures for handling exemptions and exceptions

Answer: C

Explanation:

Under Control 5.1, information security policies should include statements that define direction, responsibilities, and policy expectations, including how exemptions and exceptions are handled. Exception handling is important because policies cannot be treated casually or bypassed informally. When an exception is necessary, it should be justified, approved, documented, time-bound where appropriate, risk-assessed, and reviewed. This preserves governance and ensures deviations do not become uncontrolled weaknesses. Option A, recovery from a data breach, is important but belongs more naturally to incident management, business continuity, and response planning rather than the general information security policy statement. Option C, procedures for using automated information systems, may be addressed in acceptable use or operational procedures, but it is not the best match for Control 5.1's policy content. The information security policy establishes the authority and framework for topic-specific policies and procedures. It should include high-level statements on objectives, principles, responsibilities, compliance expectations, and exception management. Therefore, option B is verified. References/Chapters: ISO/IEC 27002:2022, Control 5.1 Policies for information security; Control 5.36 Compliance with policies, rules and standards for information security; Control 5.37 Documented operating procedures.

NEW QUESTION # 21

When can clock synchronization be difficult?

- A. When using multiple cloud services
- B. When using only on-premises services
- C. Both A and B

Answer: A

Explanation:

Clock synchronization can be difficult when using multiple cloud services. ISO/IEC 27002 Control 8.17 emphasizes that clocks of information processing systems should be synchronized to approved time sources.

Accurate time is essential for logging, monitoring, incident investigation, transaction integrity, forensic analysis, authentication, certificate validation, and event correlation. In a simple on-premises environment, an organization may centrally manage time sources using internal NTP servers or domain services. In multi-cloud environments, systems may span different providers, regions, platforms, managed services, containers, serverless functions, and third-party logging systems. Each environment may have different time settings, time source controls, administrative access limits, time zone handling, timestamp formats, and logging precision. This makes consistent synchronization and correlation more challenging. Option A is not the best answer because "only on-premises services" are typically easier to synchronize under a single administrative model. Option C is too broad because the question asks when synchronization can be difficult, and the ISO

/IEC 27002 exam logic points to multiple cloud services. References/Chapters: ISO/IEC 27002:2022, Control 8.17 Clock synchronization; Control 8.15 Logging; Control 5.23 Information security for use of cloud services.
