VMware vSphere 8.x Advanced Design Sample Questions (Q17-Q22):

NEW QUESTION # 17

Which requirement is essential to ensure that the system can handle its intended workload without performance degradation?

- A. Capacity requirements
- **B. Performance requirements**
- C. Compute requirements
- D. SLA requirements

Answer: B

NEW QUESTION # 18

An architect is reviewing the security and compliance requirements for a new application that will be hosted on a vSphere 8 environment.

The following information has been noted about the new application:

The application stores and processes confidential data

The supporting virtual infrastructure is shared with other departments

No other application stores or processes confidential data

The application virtual machines must be able to run on any ESXi host in the cluster The storage layer is a iSCSI attached SAN Data at Rest Encryption is in place for each presented LUN validated to FIPS 140-2 No budget is available for additional infrastructure components or software Application data must not be accessible outside of the application's virtual machines The architect has been tasked with providing a secure virtual machine design to host the application.

Which three design elements must the architect include to meet the requirements? (Choose three.)

- **A. The vSphere Native Key Provider**
- B. A new local VMFS volume
- C. VMware vSAN
- **D. Virtual Machine Encryption**
- **E. External Key Management Service (KMS) provider**
- F. A new encrypted iSCSI LUN

Answer: A,D,E

Explanation:

Virtual Machine Encryption

To ensure that the application's confidential data is protected, Virtual Machine Encryption should be applied.

This will ensure that even if someone gains access to the storage layer or the underlying infrastructure, the data in the virtual machine is encrypted and cannot be accessed outside of the VM, as required by the security and compliance requirements.

The vSphere Native Key Provider

The vSphere Native Key Provider can be used to manage encryption keys within the vSphere environment.

Since no budget is available for additional infrastructure components or software, leveraging vSphere's native capabilities for key management ensures that encryption is securely handled without introducing external dependencies. This also aligns with the requirement to not introduce additional infrastructure.

External Key Management Service (KMS) provider

While the vSphere Native Key Provider can manage keys within the environment, if there is a requirement for a more secure or compliant key management solution, an External Key Management Service (KMS) may be used. The KMS provider allows for centralized management of encryption keys, ensuring that the keys are securely stored and controlled according to compliance standards (e.g., FIPS 140-2). Although the Native Key Provider may suffice, this option ensures that key management adheres to stricter compliance needs, especially for confidential data.

NEW QUESTION # 19

What is the primary purpose of gathering and analyzing performance requirements?

- A. To optimize the system's data storage and retrieval processes.
- B. To define the hardware specifications required for the system.
- C. To specify the expected levels of system performance and responsiveness.
- D. To determine the number of concurrent users the system can support.

Answer: C

NEW QUESTION # 20

An organization's data scientists are executing a plan to use machine learning (ML). They must have access to graphical processing unit (GPU) capabilities to execute their computational models when needed. The solutions architect needs to design a solution to ensure that GPUs can be shared by multiple virtual machines.

Which two solutions should the architect recommend to meet these requirements? (Choose two.)

- A. vSphere DirectPath I/O
- B. vSphere Bitfusion
- C. vSGA
- D. AMD MxGPU
- E. NVIDIA vGPU

Answer: B,E

NEW QUESTION # 21

The storage team at an organization is planning to migrate from an older Fibre Channel storage environment to a new environment using IP-based storage.
