ExamPassdump의ServiceNow CIS-DF 시험자료의 문제와 답이 실제시험의 문제와 답과 아주 비슷합니다. 우리의 짧은 학습가이드로 빠른 시일 내에 관련지식을 터득하여 응시준비를 하게 합니다. 우리는 우리의ServiceNow CIS-DF 인증시험덤프로 시험패스를 보장합니다.

ServiceNow CIS-DF 시험요강:

주제	소개
주제 1	<ul style="list-style-type: none"> • CSDM Fundamentals: This domain establishes Common Services Data Model knowledge including stakeholder collaboration for CI classification, CSDM methodology adherence, and understanding implementation benefits.
주제 2	<ul style="list-style-type: none"> • Insight: This domain covers extracting value from CMDB data using Natural Language Query, custom reports, dependency views, product integrations, and Foundation Dashboards for actionable insights.
주제 3	<ul style="list-style-type: none"> • Ingest: This domain addresses data ingestion methods, CI relationship management, automation tools, upgrade compatibility, handling non-discoverable CIs and attributes, compliance tracking, and Asset-CI alignment.

주제 4	<ul style="list-style-type: none"> • Configuration: This domain covers CMDB technical setup including CI Class Manager for table hierarchies, IRE for data accuracy, and CMDB 360 • multisource configuration for comprehensive CI views.
주제 5	<ul style="list-style-type: none"> • Govern: This domain focuses on CMDB quality management through health metrics, Data Manager policies, governance frameworks, stakeholder roles, duplicate remediation, operationalization, and lifecycle management.

CIS-DF퍼펙트 덤프데모문제 & CIS-DF인증덤프공부문제

ExamPassdump의ServiceNow인증 CIS-DF덤프는 시험패스율이 거의 100%에 달하여 많은 사랑을 받아왔습니다. 저희 사이트에서 처음 구매하는 분이라면 덤프품질에 의문이 갈것입니다. 여러분이 신뢰가 생길수 있도록 ExamPassdump에서는ServiceNow인증 CIS-DF덤프구매 사이트에 무료샘플을 설치해두었습니다. 무료샘플에는 5개 이상의 문제가 있는데 구매하지 않으셔도 공부가 됩니다. ServiceNow인증 CIS-DF덤프로ServiceNow인증 CIS-DF시험을 준비하여 한방에 시험패하세요.

최신 Certified System Administrator CIS-DF 무료샘플문제 (Q71-Q76):

질문 # 71

A CMDB Administrator has installed aService Graph Connectorand customized a script transform. What will happen on subsequent upgrades if the default definition of the script transform is updated?

- A. A skipped change is created and no change is made to the script transform definition
- B. The Service Graph Connector upgrade refuses to start
- C. The upgrade stops and reports an error

정답: A

설명:

InServiceNow, Service Graph Connectors deliver data ingestion patterns usingprotected, upgrade-safe artifacts, including script transforms. When a customercustomizesa script transform provided by a Service Graph Connector, ServiceNow follows standardupdate set and upgrade behavior to protect customer customizations.

During a subsequent upgrade, if theout-of-box (default) script transform definition changes, ServiceNowdoes not overwrite the customized version. Instead, the platform records askipped change, indicating that an update was available but intentionally not applied due to a local customization. This ensures customer-specific logic is preserved while still maintaining transparency about what changed in the newer release.

Option A is incorrect because upgrades do not halt due to customized transforms. Option C is also incorrect because Service Graph Connector upgrades proceed normally; they do not refuse to start because of customizations.

This behavior aligns with Data Foundations best practices:avoid modifying OOTB content when possible, but when customization is necessary, ensure it is protected during upgrades. Administrators should review skipped changes after upgrades to decide whether to manually adopt new OOTB logic.

Therefore, the correct answer isB - A skipped change is created and no change is made to the script transform definition.

질문 # 72

(Choose 2 options)

The following Reconciliation Rules were configured for ServiceNow, Altiris, and SCCM for the Windows Server (cmdb_ci_win_server) class:

Which statements are true?

- A. Data collected with a discovery source ofSCCM can be inserted as new records in the Windows Server table.
- B. Data collected with a discovery source of Altiris can update records inserted by SCCM into the Windows Server table.
- C. Data collected with a discovery source ofServiceNow can insert new records into the Windows Server table, but cannot update records created by Altiris or SCCM.
- D. Data collected with a discovery source ofSCCM can update any record in the Windows Server table because it has the

highest priority number.

정답: A,B

설명:

This question tests understanding of reconciliation source priority in the Identification and Reconciliation Engine (IRE) in ServiceNow.

In reconciliation rules, lower numeric values represent higher priority. Therefore, the priority order is:

ServiceNow (100) - highest authority

Altiris (200)

SCCM (300) - lowest authority

Why A is correct

Because Altiris (200) has higher priority than SCCM (300), data from Altiris can update records originally inserted by SCCM. This is exactly how reconciliation precedence works-higher-priority sources can overwrite lower-priority ones.

Why C is correct

SCCM, even though it has the lowest priority, is still an authorized discovery source. It can insert new records into the Windows Server table when no existing CI is identified. Priority only affects updates, not the ability to create records.

Why B is incorrect

ServiceNow (priority 100) can update records from Altiris and SCCM because it has the highest priority. The statement incorrectly claims it cannot.

Why D is incorrect

SCCM does not have the highest authority. A higher numeric value means lower priority, so SCCM cannot update records created by higher-priority sources.

질문 # 73

The following identification rule for a Hardware CI class has been defined

Two new CI records are imported into the Hardware class of the CMDB:

CI1: The name of this CI record matches the name of an existing CI record in the CMDB.

CI2: The IP address of this CI record matches the IP address of an existing CI record in the CMDB.

Which is correct based on the identification rule and the imported CI records?

- A. CI1 will be updated with the matching record and CI2 will be inserted as a new record
- B. CI1 will be inserted as a new record and CI2 will be updated with the matching record
- C. CI1 and CI2 both will be updated with matching records
- **D. CI1 and CI2 both will be inserted as new records**

정답: D

설명:

This question tests understanding of how the Identification and Reconciliation Engine (IRE) evaluates incoming CI data against Identification Rules and their priority order in ServiceNow.

From the identification rule shown:

Serial number (+ type) # Priority 100

Serial number # Priority 200

Name (Hardware) # Priority 300

MAC address + name (Network Adapter) # Priority 400

For a CI to be identified and matched, the incoming record must satisfy one complete identifier entry exactly as defined for that class.

CI1 (Name match only)

Although the name matches an existing Hardware CI, name alone is a low-priority identifier (300) and is not sufficient to uniquely identify a Hardware CI unless no higher-priority identifiers exist and the identifier entry criteria are fully satisfied. In practice, Hardware identification relies on serial number-based identifiers, not name-only matching, to avoid false positives. Therefore, CI1 cannot be confidently matched and is inserted as a new record.

CI2 (IP address match)

IP address is not part of any Hardware identification rule shown. IP address is typically used for discovery correlation or network relationships, not as a primary Hardware identifier. Since no identifier entry includes IP address, CI2 does not match any valid identification rule and is also inserted as a new record.

Because neither CI satisfies a valid identifier entry, both records are inserted as new CIs.

질문 # 74

What ensures data volume in the CMDB is manageable?

- A. Archive Policies
- B. Scheduled Jobs
- C. Business Rules

정답: A

설명:

Managing CMDB data volume is a key Data Foundations governance objective. Over time, CMDBs naturally accumulate retired, obsolete, or decommissioned CIs. If these records are not properly managed, they degrade CMDB performance, reduce reporting accuracy, and negatively impact discovery reconciliation and health scores.

Archive Policies are the mechanism designed to address this challenge. They define when CI records should be archived or deleted based on lifecycle state, age, or retention requirements. By automating archival and cleanup, archive policies ensure that only relevant, active CIs remain in the operational CMDB, keeping data volume manageable and performant.

Business Rules (Option A) are used to enforce logic during record creation or updates, not for long-term data volume control.

Scheduled Jobs (Option B) may execute tasks, but without archive policies they have no governance logic to determine what should be removed or retained.

Archive policies work in conjunction with CMDB Data Manager to enforce lifecycle-based retention and cleanup, making them the correct and verified answer.

Therefore, Option C - Archive Policies is correct.

질문 # 75

A CMDB Data Manager needs to access the ServiceNow platform to create, publish, and manage policies that automate and govern CI lifecycle operations, ensuring the CMDB remains healthy and efficient.

Where can the Data Manager do this?

- A. CMDB Workspace - Management tab
- B. CI Class Manager
- C. CMDB Workspace - CMDB 360 tab
- D. Service Operations Workspace

정답: A

질문 # 76
