

Pass Guaranteed 2026 Python Institute High Hit-Rate PCEP-30-02 Certification Test Questions

What's more, part of that PrepPDF PCEP-30-02 dumps now are free: https://drive.google.com/open?id=1w2R-X4ai_gY7Ogd3WEAHE-Y591zPKKHT

Our PCEP-30-02 learning materials are new but increasingly popular choices these days which incorporate the newest information and the most professional knowledge of the practice exam. All points of questions required are compiled into our PCEP-30-02 Preparation quiz by experts. By the way, the PCEP-30-02 certificate is of great importance for your future and education. Our PCEP-30-02 practice materials cover all the following topics for your reference.

The more efforts you make, the luckier you are. As long as you never abandon yourself, you certainly can make progress. Now, our PCEP-30-02 exam questions just need you to spend some time on accepting our guidance, then you will become popular talents in the job market. As a matter of fact, you only to spend about 20 to 30 hours on studying our PCEP-30-02 Practice Engine and you will get your certification easily. Our PCEP-30-02 training guide can help you lead a better life.

PCEP-30-02 Practice Test | Latest PCEP-30-02 Examprep

If you can get the certification for PCEP-30-02 exam, then your competitive force in the job market and your salary can be improved. We can help you pass your exam in your first attempt and obtain the certification successfully. PCEP-30-02 exam braindumps are high-quality, they cover almost all knowledge points for the exam, and you can master the major knowledge if you choose us. In addition, PCEP-30-02 Test Dumps also contain certain quantity, and it will be enough for you to pass the exam. We offer you free demo for you to have a try, so that you can have a deeper understanding of what you are going to buy.

Python Institute PCEP-30-02 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Control Flow: This section covers conditional statements such as if, if-else, if-elif, if-elif-else
Topic 2	<ul style="list-style-type: none">Loops: while, for, range(), loops control, and nesting of loops.
Topic 3	<ul style="list-style-type: none">Computer Programming Fundamentals: This section of the exam covers fundamental concepts such as interpreters, compilers, syntax, and semantics. It covers Python basics: keywords, instructions, indentation, comments in addition to Booleans, integers, floats, strings, and Variables, and naming conventions. Finally, it covers arithmetic, string, assignment, bitwise, Boolean, relational, and Inputoutput operations.

Python Institute PCEP - Certified Entry-Level Python Programmer Sample Questions (Q17-Q22):

NEW QUESTION # 17

Drag and drop the literals to match their data type names.

Answer:

Explanation:

Explanation:

□

NEW QUESTION # 18

Python Is an example of which programming language category?

- A. interpreted
- B. assembly
- C. compiled
- D. machine

Answer: A

Explanation:

Explanation

Python is an interpreted programming language, which means that the source code is translated into executable code by an interpreter at runtime, rather than by a compiler beforehand. Interpreted languages are more flexible and portable than compiled languages, but they are also slower and less efficient. Assembly and machine languages are low-level languages that are directly executed by the hardware, while compiled languages are high-level languages that are translated into machine code by a compiler before execution.

NEW QUESTION # 19

What is the expected output of the following code?

□

- A. 0
- B. 1
- C. The code outputs nothing.
- D. 2

Answer: A

Explanation:

Explanation

The code snippet that you have sent is checking if two numbers are equal and printing the result. The code is as follows:

```
num1 = 1 num2 = 2 if num1 == num2: print(4) else: print(1)
```

The code starts with assigning the values 1 and 2 to the variables "num1" and "num2" respectively. Then, it enters an if statement that compares the values of "num1" and "num2" using the equality operator (==). If the values are equal, the code prints 4 to the screen. If the values are not equal, the code prints 1 to the screen.

The expected output of the code is 1, because the values of "num1" and "num2" are not equal. Therefore, the correct answer is C. 1.

NEW QUESTION # 20

What is the expected output of the following code?

□

- A. *
- B. * * *
- C. * *
- D. The code produces no output.

Answer: C

Explanation:

Explanation

The code snippet that you have sent is a conditional statement that checks if a variable "counter" is less than 0, greater than or equal to 42, or neither. The code is as follows:

```
if counter < 0: print("") elif counter >= 42: print("") else: print("")
```

The code starts with checking if the value of "counter" is less than 0. If yes, it prints a single asterisk (*) to the screen and exits the statement. If no, it checks if the value of "counter" is greater than or equal to 42. If yes, it prints three asterisks (**) to the screen and exits the statement. If no, it prints two asterisks (*) to the screen and exits the statement.

The expected output of the code depends on the value of "counter". If the value of "counter" is 10, as shown in the image, the code will print two asterisks (**) to the screen, because 10 is neither less than 0 nor greater than or equal to 42. Therefore, the correct answer is C. **

NEW QUESTION # 21

What is the expected output of the following code?

- A. The code raises an unhandled exception.
- B. ('Fermi', '2021', 'False')
- C. 0
- D. False

Answer: B

Explanation:

Explanation

The code snippet that you have sent is defining and calling a function in Python. The code is as follows:

```
def runner(brand, model, year): return (brand, model, year)  
print(runner("Fermi"))
```

The code starts with defining a function called "runner" with three parameters: "brand", "model", and "year".

The function returns a tuple with the values of the parameters. A tuple is a data type in Python that can store multiple values in an ordered and immutable way. A tuple is created by using parentheses and separating the values with commas. For example, (1, 2, 3) is a tuple with three values.

Then, the code calls the function "runner" with the value "Fermi" for the "brand" parameter and prints the result. However, the function expects three arguments, but only one is given. This will cause a `TypeError` exception, which is an error that occurs when a function or operation receives an argument that has the wrong type or number. The code does not handle the exception, and therefore it will terminate with an error message.

However, if the code had handled the exception, or if the function had used default values for the missing parameters, the expected output of the code would be ('Fermi', '2021', 'False'). This is because the function returns a tuple with the values of the parameters, and the `print` function displays the tuple to the screen.

Therefore, the correct answer is D. ('Fermi', '2021', 'False').

NEW QUESTION # 22
